2. Welcome to the DV Access Point Dongle group

Yahoo group: DVAPDongle
Date: 2010-02-15 21:57:25 UTC
From: aa4rc
Topic: 2 Message: 2

Thank you for joining the DV Access Point Dongle group. Here you will find notices of new software updates, usage tips and techniques, discussions of issues found by users, and requests for new functionality in the DVAPTool software.

Here is a quick start guide that can also be found at http://dvapdongle.com :

Getting started with the DV Access Point Dongle:

0) GET REGISTERED! If you are not already registered on the D-STAR network, you need to get registered. It is very important that you register with ONE gateway only. Once you are registered on one gateway, you are registered on them all. Follow the instructions at http://www.dstargateway.org for registration. Until you are registered, you will only be able to listen to connected systems. No transmission is allowed for unregistered callsigns.

1) Make sure you are connected to the internet.

2) Plug in the DVAP to an available USB port on the PC/Mac. On Windows, wait for FTDI drivers to automatically load. On Mac, go to http://www.ftdichip.com/Drivers/VCP.htm and download and install the driver for Mac OS X. On Linux, the driver is built into the kernel so no installation is required.

3) Download DVAPTool from http://www.opendstar.org/tools. Use:
DVAPTool.exe for Windows
DVAPTool-linux for Linux
DVAPTool-mac.tgz for Mac (double-click on the downloaded file and double-click on the included package installer)
NOTE: the name of the file may include the version of the software (e.g. DVAPTool-1.01.exe or DVAPTool-1.01-mac.tgz)

4) Run the DVAPTool version that was downloaded, usually by just double-clicking on the application.

5) Enter your callsign in the callsign box. It is recommended that you go to the gateway where you registered and add a terminal entry with an "A" in the initial field. Then enter your callsign with the "A" in the eighth character in DVAPTool. The "lock callsign" checkbox is used to prevent others from transmitting using your DVAP. If you want to allow other licensed amateur operators to use your DVAP, simply uncheck the box.

6) Enter a simplex frequency for operation. Consult the frequency bandplan for your country/area for appropriate frequencies. Enter the entire frequency in Hz (e.g. 146550000 for 146.550 MHz).

7) Click "Open". You can walk away from the PC/Mac now since all control commands are issued from your D-STAR radio.

Radio reference:

Enter your callsign into the MYCALL field of your radio. Select DV mode and configure simplex operation, usually by holding down the "DUP" key until there is no "dup+" or "dup-" on the radio display. You do not need to enter RPT1 nor RPT2 since the radio will place "DIRECT" in both when in simplex mode. All commands are entered into the URCALL field as detailed below.

Command reference:

URCALL:
"DVAP I" (request voice ID from the DVAP)
"DVAP E" (key down and speak for echo test)
"CQCQCQ " (transmit to a connected system)
"xxxxxxmL" (to link, replace XXXXXX with the gateway or reflector callsign making sure to use 6 characters filling the end with spaces as needed. Replace the "m" in the 7th character with the module to which you wish to link. Use "L" in the 8th character to indicate the Link command. For example, to link to Reflector 001 module C, use "REF001CL" in URCALL. To link to gateway W4DOC module A, use "W4DOC AL" in URCALL.
" U" (unlink from a linked gateway/reflector)
Note that, other than "CQCQCQ ", the commands above are processed locally and not transmitted to a connected system.

You may record and playback conversations by clicking the "Record" and "Playback" buttons. While playing back, you can click the "Skip to next keyup" to skip to the next person talking. Note that playback is done only to your radio, not to a connected gateway or reflector.

Customizing voice playback:

You can replace the included files that are played to indicate command actions. The files are:

alreadylinked.dvrec (played when you try to link when linked)
alreadyunlinked.dvrec (played when you try to unlink when unlinked)
dvap-id.dvrec (played when "DVAP I" is issued)
gatewayunknown.dvrec (played when the requested gateway is unknown)
remotesystemliked.dvrec (played when the requested system is linked)
remotesystemlinkedro.dvrec (played when the requested system is linked receive only)
remotesystemunlinked.dvrec (played when the linked system is unlinked)

To record a file, make sure the DVAP is open and not connected to a remote system. Click the "Record" button. Key down and speak your announcement. Click "Stop recording". Listed to your recording by

clicking on "Playback". You may record the announcement as many times as you like until you are happy with it. DVAPTool places the recording in the file dvaptool.dvrec in the folder from which it was started. Simply rename "dvaptool.dvrec" to one of the above file names to have DVAPTool use it instead of the default.

Please make sure you join the DVAPDongle yahoo group for program update announcements. Go to http://groups.yahoo.com/group/DVAPDongle to join.

6. DVAP won't connect to local repeater

Yahoo group: DVAPDongle
Date: 2010-02-15 21:00:19 UTC
From: mrgadgetfl
Topic: 6 Message: 6

I received my DVAP today. It connects to REF002 fine, but will not connect to either port of my local DSTAR repeater, KI4WZA.

It starts with "state change 4 Authenticating...", then "login failed", then "state change 7 Disconnecting...", "gateway response timeout 7", "state change 1 Disconnect timeout."

My old DVDongle works fine with this repeater.

Also, the email address shown in the instructions shipped with the dongle, support@dvapdongle.com, is invalid.

Please advise.

Wayne, K4GQS

Hi k4wam.

DVAPTool works using the same protocols as DVTool for the DV Dongle. As a result, there is no "callsign routing" feature so direct connection between DVAP's is not currently supported. Of course, if there is sufficient demand, it can be added.

Hi Wayne. The DVAP requires a server software upgrade to connect. All of the reflectors have been updated and so have many of the gateways. The gateway admins have been informed of the availability of the upgrade so, hopefully, you will be able to connect soon. You might contact your local gateway admin to "nudge" him.

I would like to see the ability to call a specific station - that station being a dongle or otherwise. That to me is one of the many advantages and the main purpose for my interest in DSTAR. My wife and I are often in places with limited at best cell phone coverage but good DSTAR coverage.

10. New feature requests (already!!)

Yahoo group: DVAPDongle
Date: 2010-02-16 02:12:52 UTC
From: mrgadgetfl
Topic: 10 Message: 10

Robin,

I'd like to see the new DVAP software with the same tabs as were available with the old Dongle software, i.e., Info, History, Data. The biggest negative I've heard is the lack of that information with the DVAP. (I currently have both, along with mobile and HT rigs).

Wayne, K4GQS

11. Re: [DVAPDongle] New feature requests (already!!)

Yahoo group: DVAPDongle

From: Tim Barrett
Topic: 10 Message: 11

If the purpose of the DVAP is to allow a radio users, that can not get directly into a D-Star Gateway, to gain access, why would these tabs be needed?

Presumably, I would be on my radio (hand-held).

Tim

This DVAP is a different animal from the orginal Dongle. It is really a small repeater to allow users to use a radio over a short distance to access the gateway. Once it is connected you have no need to look at it anymore since the radio is used to control everything just like you would going through any other repeater.

Bill,

You don’t NEED more than one entry. Only one will work.

Robin recommends adding another one to your call sign so that if someone tries to call sign route back to you, they will route to the real repeater that your radio was connected to. I’m only using one and I don’t think that I’ll worry about setting it up as Robin has suggested, at least I haven’t found a compelling reason yet.

On the other hand, I do have 2 terminals registered because I’ve got 2 ID-1s and when in data mode, they each need their own IP address which is associated with a terminal. Aside from that, there really is little reason to have more than 1 terminal associated with your account.

Some people try to treat it like a packet SSID and have one for every radio, but that’s not really a correct use.

27. DVAPTool 1.01 Shows "Transmitting..." when not transmitting

Yahoo group: DVAPDongle
Date: 2010-02-18 00:59:20 UTC
From: mrgadgetfl
Topic: 27 Message: 27

Frequently the DVAPTool 1.01 PC screen starts showing "Transmitting..." and the timer starts running, while connected to a Reflector, when the DVAP has not been keyed by an HT and the DVAP is not, in fact, transmitting (as verified by observing the Reflector with an original DVDongle. Nothing is displayed for My:, UR:, R1:, or R2: while this is occurring. DOS-like PC window shows "Transmit State <OFF>".

Running Windows 7 Home Premium 64-bit.

From: wb4qdx
Topic: 28 Message: 30

While very tempting, we all need to be very careful with accessories such as amplifiers on the DVAP. From an RF perspective, adding an amplifier only boosts one side of the RF path (from the DVAP to the radio). If you don't increase the received signal coming back, you will have garbled or one-way transmissions.

We also need to keep in mind that the DVAP is not a substitute for a full repeater and we should not try to make it one. Yes, repeaters are expensive and the DVAP is a much more economical way to create a "D-STAR coverage zone", but higher power radios have more extensive filtering and shielding built in to prevent spurious emissions in and out of band. We could end up causing interference.

Also, the RF section of the DVAP has virtually no AGC on the receiver. You may have noticed that the DVAP may not see your transmission if keyed very close to it. That's because you're overloading the receiver side and it's presenting garbage as decoded data. You should also operate your radio in low power mode. The DVAP is only transmitting 10mw. Running your radio at higher power settings doesn't give more range if the DVAP is limited to very low power.

The DVAP is a wonderful device to create a small coverage area. Thanks, Robin and Moe.

Hi Tim. The DV Access Point Dongle uses the same infrastructure as the DV Dongle. Gateways should already have the ports they need forwarded and there is no requirement for port forwarding local to the DVAP.

For a DVAP user, no specific ports need to be forwarded.
For the Gateway, you should configure for standard DVDongle access.

In other words, no specific settings need to be made for the DVAP to work. I've already used it on cellular cards, home Internet, and Hotel Internet. It won't work on my corporate network because they have all outgoing traffic blocked (except for that which goes through the proxy)

From: Woodrick, Ed
Topic: 5 Message: 34

Duffy,

I'm not sure how many orders were taken at Orlando. All of the initial batch was pre-ordered, so no one came up and bought one and received it at the hamfest. Anyone who bought one at the hamfest is now on the waiting list for the next batch. Rumor has it that the second batch is about 2 months away. The majority were shipped from HRO Atlanta last Friday.

Most of the folks on the initial list had been waiting for a number of months. I ordered mine the first week of November and waited 3 months

Until then, you'll just have to wait with eager anticipation. But it's worth the wait! For your position on the waiting list, you'll have to check with HRO.

Jeff:
If your DV Dongle has been on the back burner for a while, what are you looking to do with the DVAP? It's unfortunate that there are no repeaters in Detroit (yet), but you can still be active on D-STAR with the Dongle to other cities. By your interest in the DVAP, I'm assuming you already have a D-STAR radio, preferably an HT. With no local repeaters, you will still talk to the same places on either. The DVAP will give you some limited mobility (around the house) with a radio.

One other benefit of the DVAP is creating a mobile "D-STAR coverage zone". I operated my DVAP in the car connected to a laptop with the cellular aircard to provide Internet connectivity. With my HT in the vehicle, I had mobile D-STAR coverage where there were no repeaters.

You are probaly right that if you show off D-STAR with a DVAP, you may generate more interest in D-STAR that hopefully gets a repeater in your area. Good luck and hope to hear you on D-STAR.

Jeff,

The price is $249.00. You'll have to check to see if other dealers will carry them. However, I would call Mark at HRO in Atlanta if you are interested.

Also, have you contacted any of the repeater groups in the Detroit area to see if they have any interest in building a D-Star system?

BTW, lived in St. Clair Shores when I was a lot younger.

HRO bought all of the first shipment. I'm not sure what other vendors will have access to the next shipment, but I'm sure HRO will get a good portion of it. You can order it online from HRO for $249.95 USD.

Don't look for the DVAP to cover the Detroit/Windsor area, it's only 10mW.

While it doesn't look like there are any repeaters new downtown Detroit, there does seem to be a few west of town.

44. DVAP Operation Suggestions

Yahoo group: DVAPDongle
Date: 2010-02-19 22:36:16 UTC
From: moe_wheatley
Topic: 44 Message: 44

Hi to all new DVAP users,
Just some thoughts on setting up and using the DVAP device.

Choosing a frequency to operate on should be carefully considered before using the DVAP. The first thing to consider is to follow the band plan for your particular region. The ARRL publishes a band plan document for the US that can be used to narrow your choices.
http://www.arrl.org/FandES/field/regulations/bandplan.html

Frequencies to avoid are those in the weak signal and satellite sections of the band and of course all the local repeater input and output frequencies. Also avoid common FM calling frequencies such as 146.52 and Packet frequencies such as used for APRS.
The output power of the DVAP is very low(~10mW) and the antenna is very low gain so the chance of it interfering is quite low since it can only be heard over a small area. However, your hand held(or mobile) D-Star transceiver is quite capable of transmitting over much longer distances so it is important to operate it at as low a power setting as possible and avoid frequencies that may interfere with others. The added benefit of operating at lower power is that your battery life will be extended.

Another frequency range to avoid is from around 147.4 MHz to 147.6 MHz. The DVAP has an internal spur at 147.456 MHz that mixes with the GMSK signal and produces spurious products within this range. Although they are not as strong as the main signal and the DVAP is low power to begin with, one may want to avoid this range unless it is the only one available.

On the receive side, since the DVAP most likely will be physically located very close to a PC and assorted digital devices, it is very likely that there will be all sorts of interference to the DVAP on various frequencies. One way to find a clean frequency is to put your hand held radio in FM mode and open up the squelch. Tune around the area of interest and listen for interfering signals which are indicated by either quieting of the noise or assorted squeals and buzzes characteristic of computer generated noise. Locating the DVAP as far away from your PC will also help. Another indication of interference is by looking at the RSSI (Receive Signal Strength Indication) that is displayed on DVAPTool. A normal reading without a signal should only be 1 to 3 bars.

The squelch setting is not that important for DStar receivers. On the DVAP it is only used to qualify voice packets that are received without a header. This reduces the chance that a bogus voice packet will be received in the noise. A mid range setting should be fine. There is no sensitivity advantage to have the squelch completely open or completely closed.

An external outdoor antenna can be used to extend the range somewhat. As an example an outdoor vertical antenna on my roof extended the range to around 1000m. Of course your range will depend on all the normal factors such as height, antenna gain, etc.

It may be tempting to try and extend the range of the DVAP even more by adding a power amplifier to it. This is NOT a good idea for several reasons.
Primarily, the DVAP was NOT designed to produce as clean a signal that a full blown transceiver is required to produce. While the DVAP GMSK signal is quite pure, it does produce a higher phase noise floor due to the simple single chip transceiver design. What

this means is that for low power, the noise floor is not an issue but if amplified, then it may interfere with adjacent frequencies.

The DVAP receiver is not as sensitive as a normal radio and also has less selectivity so would produce sub-par performance if one were to try and use it for long range operation or in a noisy urban environment.

The DVAP works quite well for its intended purpose as a short range radio transceiver but not as a high power "Hot Spot" transceiver for serving a wide area.

The DVAP frequency reference is not temperature compensated so will drift with temperature. It is calibrated at normal room temperatures and will be ok in the normal home/office environments however may drift several KHz if placed in extreme temperatures such as in a car in the hot sun or outside during the winter.

Sorry for the long winded post but it may be helpful in setting up and using this new type device. I plan on publishing more technical information in the coming weeks when things calm down a bit.

Hi Mike. This happens when a DV Dongle user connects and then immediately starts transmitting rather than waiting to see if there is a conversation in progress. Users should always listen first before transmitting.

We have ZERO Repeaters and in need of some kind of Hotspot/or Access point in the Area..
This will be at least some way to get some activity in the Area for those that are not able to make the 2 Repeaters Well WEST of the Metro Area. If you look at a Map, you can start in Ohio and Drive to Flint Michigan before you get ANY kind of D-Star Repeaters..
MY thought is to make this a HOTSPOT with some kind of coverage on 45.670 Simplex to keep those that do still have Radios in the Area, a Way to gain access .....

Hey Duffy;
There have been Rumors of interest for a Few Years now, but Nada..
The GM Radio club is one that always had the new stuff and got it running as one example there repeater on the Ren-cen (Picture Detroit, the Tall Round Building) is now the GM HQ.
There Repeater Antenna is on top. But even they haven't done anything.
Tried to talk to some of the EOC's and same thing in S.E-MI..

52. gateway list question

Yahoo group: DVAPDongle
Date: 2010-02-20 15:10:59 UTC
From: Francis Miele
Topic: 52 Message: 52

I am wondering when the gateway list gets loaded into the DVAPtool and if it gets refreshed periodically while the tool is running. The reason for the question is that yesterday, several of us started our DVAPtool while reflector 10 was inaccessible. Then ref 10 became accessible but we couldn't link to it unless we closed the DVAPtool completely and restarted it.

A Quick Note about Detroit and surrounding Areas. YES this area is still here but Dying Faster than Ever.
There are ZERO Repeater Pairs (According to the Michigan Repeater Council) for the Entire Southern 3/4 of Lower Michigan. So there will be NO NEW machines. And trying to Convince any of the Current Repeater Owners to run D-Star is about impossible. We have one in HELL, Michigan, and one in Howell, Michigan that have Great Coverage for themselves, but much EAST of me you cant get in, and Definitely NOT via Mobile or HT..

From: Woodrick, Ed
Topic: 54 Message: 58

There are ZERO UHF repeater pairs on 440? There are ZERO UHF repeater pairs on 1.2GHz? Sounds a little strange to me.

And I think that you are missing everyone's point about the DVAP "covering the area" It's a 10mW transmitter and a receiver that isn't designed for repeater operation. The only coverage that you will get is your house.

I'd be really surprised if you can't get a repeater pair for 440. It also looks as if Michigan is attempting to put some D-STAR repeaters in between FM repeater channels on 144 and 440 MHz.

59. Receive Mode Only?

Yahoo group: DVAPDongle
Date: 2010-02-21 01:52:21 UTC
From: choneyfi
Topic: 59 Message: 59

Hello,

My callsign is registered on the gateway but whenever I try to connect my DV Access Point dongle to a reflector, it says "remote system connected, receive mode only." I have made sure my call sign is entered correctly into the software etc.

I am just using my regular callsign without the "A" appended to it.

In the cmd window, it says login OK, transmit not permitted. Anyone have any idea what I am going wrong? I made sure the calsign that I entered in the software matches the same call sign I have in my radio under "My Call Sign"

Thanks

KG6FIV

Jeff,

Then until someone wants to change and existing system to a D-Star repeater you have two choices. Use the DVAP for just around your house and yard....or, get a hotspot which depending on antenna, could give you several miles of coverage...or ten or more miles, depending how high you can get the antenna.

Ed;
I Think there might be some 440 Pairs, but Even back some Years there were NO 220 Pairs. The MARC (Michigan Repeater Council) seems to just not want to clear up some Paper Repeaters.. As for Coverage area, I was going to use the IC-2820 to Cross band into the DVAP, this would allow a Link to a Friend in Windsor and give some (Albeit weak) coverage and allow some use. Thinking if I do this, and someone 10miles away does it, and 10 from them at least have a way to communicate. A simple Idea..

Duffy;
There is NOW a Hotspot in Windsor (VE3LDJ), and my thought was to use my 2820 to crossband into the DVAP, and create a link direct. This would allow 440 in my Area and 2 meter in Detroit/Windsor area.
YOU'D really think this area would have a Machine or any of the County EOC's would have something going...

Craig,
You must log into D-Star registered site and add
KG6FIV A and another ip address will be assigned to you.
This was the same site you initially registered for D-Star.

It takes about two hrs to update the logs.

Then enter KG6FIV A into DVAP window.

Give that a try

67. DVAP Access ???

Yahoo group: DVAPDongle
Date: 2010-02-21 19:34:36 UTC
From: Dale Grant
Topic: 67 Message: 67

Just wondering if I have a problem with my DVAP of maybe the DVAP has the problem. Using a 91AD.

My problem is that most of my transmission are to my self. If I am not watching the computer I never know if I am going out the dongle or its just going nowhere. I do notice that the signal seems to be ok but there is no data showing up in the Mycall and UR settings. When no data shows I do not go any where and under test I may have to key my radio 4 or 5 times before any data shows up. When there is data is works well. Also I do not seem to get any range. Maybe 30 yards before it will not work anymore however I can certainly hear it a long ways. I have tried different locations, cables and another computer, results are the same. I even tried it with my base station which is a Icom 800. Same results.

Wondering if any one else has this issue or should I be sending this unit back. A friend of mine locally should have his in the coming week. I will see what his results are.

From: ian_vk2hk
Topic: 69 Message: 69

Well my DVAP arrived today, installed the software onto my Windows 64bit machine and tested it, all worked OK for short overs of about 10 seconds, if I continue to talk past that the DVAPTools goes into an error and drops out. Loaded it onto my netbook running XP and all works fine, so it has a problem with "my" 64 bit PC. I will eventually be running it off a Linux netbook, so hopefully those issues will be gone.

Great work Robin, love it, gives me freedom around my property to use my 92AD.
I will also be setting it up at our Wyong Field day this Sunday 28th Feb.

Hi Ian. That is correct. You can have "VK2HK A" as your station call and "VK2HK " as your radio mycall and make it through with the "lock callsign" box checked.

Thanks for pointing this out.

With a Windows 7 x64 machine that was connected to the Internet, the drivers were automatically downloaded and installed for my system. Just make sure that the system is connected to the Internet and that you haven't said no to any of the auto-install driver questions in the past. And you probably want to plug in the device after you are booted and logged on.

77. Registration Question

Yahoo group: DVAPDongle
Date: 2010-02-23 19:18:02 UTC
From: Jess
Topic: 77 Message: 77

I received my DVAP on Saturday. I played with it a little bit on Sunday but never heard anyone. It seemed to be working correctly.... but:

Robin's instructions say, "It is recommended that you go to the gateway where you registered and add a terminal entry with an "A" in the initial field".

Unfortunately the gateway where I'm registered (K2DIG) is having technical issues and is evidently not communicating with the trust servers. I believe someone from that group will have to go to the site to reset their gateway box. So here's my question: Must I await the the registration server to "return to health" before I can use my DVAP?

Mike,

There should be no difference in using D-RATS with a radio with a repeater, then with a DVAP.

The easiest way to describe the configuration would be to use two computers. On computer 1, you have a D-STAR radio with DRATS and a serial connection to a radio. This is the normal configuration for DRATS.

On computer 2, you have a DVAP and an Internet connection. The radio and the DVAP are set for the same frequency.

On the radio, you run DRATS just as you would if you are using a repeater. (except for the radio linking commands)

You can combine the two functions together on one computer, but you don't get any additional functionality.

You can't use DRATS to talk directly to the DVAP software. DRATS talks to a radio, the radio talks to DVAP, DVAP connects to the DSTAR network.

Topic: 74 Message: 86

To keep people from being confused, I would recommend setting up the DVAP-> Internet connection on one computer on one side of the booth and then setting up the DRATS -> Radio connection on the other side.

That also allow two conversations with attendees to take place, one showing the data capabilities, the other showing the DVAP capabilities.

Now, of course, in the center of the booth you have another computer with a DVDongle!

If you’ve got the room, then you also bring out 2 ID-1s to talk to each other.

thanks Adrian,

So that would be a computer running D-RATS hooked to a D-STAR radio (icom or not?) with a DVAP linked to a repeater or reflector?

That is pretty nice. We can use that to demo all this at Winterfest in NoVa this coming weekend. We have several icom radios and the DVAP but might just be out of range of one of our gateway connected repeaters.

From: Woodrick, Ed
Topic: 77 Message: 87

Jess,

You don't have to add the additional registration. I wouldn't even recommend doing so myself. The DVAP works absolutely fine without it.

Take a look at the nets listing at http://www.dstarinfo.com/Nets/Nets.aspx and connect to one of the many nets listed this evening and see if you can hear anything.

Since you mentioned that you heard nothing, let me go through some basic steps to make sure that you are using it correctly.

Just sitting there, the DVAP doesn't do anything. To make it do something, you will have to issue commands to it from your radio.
You need to make sure that the DVAP and the radio are on the same frequency and that the radio is on simplex.
When you key the radio, you should see your callsign on the DVAP software. (Make sure that you are a couple of feet from the DVAP and on low power, the DVAP receiver can easily be overloaded).
For first test, program in the DVAP the Information request command (DVAP***I in the UR field) (RPT1 and RPT2 are not used in simplex)
Press the PTT for about a second, when you unkey, you should hear the DVAP respond.

For the next test, program the DVAP with the Echo Test command (DVAP***E in the UR field) (RPT1 and RPT2 are not used in simplex)
Press the PTT and say something, the DVAP will then respond with what you said.

Next you need to link to a reflector, for testing, use REF001C, one of the busiest reflectors in the world. Program your radio with the reflector name and the L in the UR field. (REF001CL in the UR field) (RPT1 and RPT2 are not used in simplex)
Press the PTT for about a second, when you unkey, you should hear "Remote System Connected" from the DVAP.

Change your UR field to CQCQCQ and you should be able to talk to anyone.

Use the U command to unlink or hit the button on the software.

There's definitely people out there. You can also watch the last heard list at www.DSTARUsers.org<http://www.DSTARUsers.org> and see where QSOs are currently occurring.

Subject: [DVAPDongle] Registration Question

I received my DVAP on Saturday. I played with it a little bit on Sunday but never heard anyone. It seemed to be working correctly.... but:

Robin's instructions say, "It is recommended that you go to the gateway where you registered and add a terminal entry with an "A" in the initial field".

Unfortunately the gateway where I'm registered (K2DIG) is having technical issues and is evidently not communicating with the trust servers. I believe someone from that group will have to go to the site to reset their gateway box. So here's my question: Must I await the the registration server to "return to health" before I can use my DVAP?

Jeff,

The frequency really doesn't matter. As long as your radio and the DVAP are set for the same frequency, then things should work.

Why is a specific frequency band an issue for you?

Ed;
If I can have the DVAP on 70cm, I could have the 145.670 (DV Simplex Freq) on the IC-2820 and use it to Cross-band.
There is a small group 5-6 Local that use Simplex and we meet up, But 2 of the Guys only have the 2Meter Icom for D-Star, not Dual Band Radios. THIS would give them Access to some of the Features that are available. Really Suprized that the Metro Detroit Area has NO Repeaters, this might keep some interest and be used as such till something does happen. BUT being on 70cm low power and 2Meter High for Cross-Band would be the best in this area for Now...

92. Re: Registration Question

Yahoo group: DVAPDongle
Date: 2010-02-25 14:54:41 UTC
From: Jess
Topic: 77 Message: 92

Hi Ed:

Thanks for your comments. I'll try again this evening now that I know I don't need the 2nd listing at the registration server. I'd decided not to fool around with it until that question was resolved.

I played with the DVAP for only a short time Sunday afternoon and it's possible that it was simply a short time slot when no one was around. I tried REF010C (the one linking most D-Star repeaters in CT) and then for a few minutes REF001C during which time I heard nothing.

I don't have my IC-92AD at work so I can't check the RPT1/RPT2 settings, but I did get audio responses from the DVAP so evidently I got at least some of it right. Also I saw an unusual listing for me on the DPlus Dashboard at our repeater (W1NLK/R) which implies that it heard me. I remember seeing the term "DVD" or something like that associated with my call.

Sounds like it might have been working. As much traffic as it gets there are times when REF001C can go quiet for a long time.

Pick one of the net times at http://www.dstarinfo.com/Nets/Nets.aspx and you should hear some activity.

103. 70cm version

Yahoo group: DVAPDongle
Date: 2010-03-06 07:04:50 UTC
From: michaelcarey69
Topic: 103 Message: 103

Hi Everybody,

Does anyone know if there will be a 70cm version of the DVAP?
I've already got too much in the way of 2m gear running at my house (IRLP node, APRS I-Gate, plus all the other electronic gear that seems to radiate noise on 2m).
I've tried running my 2m DV Node Adapter Hot Spot at home and the other services knock it around a bit.

Michael.

Here is a link to the ADF7021 Transceiver chip in the DVAP

http://www.analog.com/static/imported-files/data_sheets/ADF7021.pdf

Looks like 70cm could be done.

Subject: [DVAPDongle] 70cm version

Hi Everybody,

Does anyone know if there will be a 70cm version of the DVAP?
I've already got too much in the way of 2m gear running at my house (IRLP node, APRS I-Gate, plus all the other electronic gear that seems to radiate noise on 2m).
I've tried running my 2m DV Node Adapter Hot Spot at home and the other services knock it around a bit.

Topic: 103 Message: 105

The DVAP uses Analog Devices ADF-7021 transceiver IC.

The transceiver IC in the DVAP can work from 80 MHz to 940 MHz
I believe the IF is 200KHz. Looks like it can work on 70cm.
The software to enter frequency would need to be opened up to allow 70cm input
and possibly the reference oscillator and settings for the frequency, depends on
frequency, divide by 2, etc. see data sheet from analog devices..
****
FEATURES
Low power, low IF transceiver Frequency bands 80 MHz to 650 MHz 862 MHz to 940 MHz
Modulation schemes 2FSK, 3FSK, 4FSK Spectral shaping Gaussian and raised-cosine filtering
Data rates supported 0.05 kbps to 25 kbps 2.3 V to 3.6 V power supply Programmable output
power −16 dBm to +13 dBm in 63 steps Automatic PA ramp control Receiver sensitivity −125
dBm at 1 kbps, 2 FSK On-chip VCO and fractional-N PLL
****
The link to more data is below
http://rfdesign.com/mag/610RFD30.pdf
Also there is a pdf fil on the analog devices website you can download on the ADF-7021
Mike

Hi Fran. You will get the link status in your message field, not via voice. You will also get the currently linked system in the message field when you unkey from a transmission.

110. DVAP and DPRS data

Yahoo group: DVAPDongle
Date: 2010-03-20 18:49:27 UTC
From: Francis
Topic: 110 Message: 110

I see the DVAP passes gps data when i transmit from my 92AD with gps mic, however, it doesn't seem to pass it correctly. If I transmit via our repeater my location appears on the APRS system. When I switch to the DVAP, my location does not appear.

Is the DVAP supposed to be passing the data?

Fran, W1FJM

111. Re: DVAP and DPRS data

Yahoo group: DVAPDongle

From: aa4rc
Topic: 110 Message: 111

Hi Fran. The gps data is passed through to the network. Remember that it is DStarMonitor on the gateway systems that collects the gps data and passes it to the APRS network. DStarMonitor is watching the link between the controller and the gateway pc for gps data originating from the RF module. Your DVAP data does not pass through DStarMontior from the RF module so it is not passed into the APRS network.

One of the enhancements to DVAPTool I hope to make is parsing the gps data in a similar way to DStarMonitor and passing it to the APRS network.

FWIW, I ordered my DVAP on 16 March and am in this group of back orders, so I am very happy!

Yes, thanks to Robin for keeping the mill running and a special thanks to Mark at HRO Atlanta for getting all those back orders out in such a timely manner!

I live in an area where getting into the local DSTAR machines is difficult, so I am really looking forward to having the DVAP. The local reviews have been incredibly positive and there seems to be a lot of excitement and creativity generated by this great new tool.

Peace and Good,
Stephen W3SMK

Hi Sam. The DV Access Point Dongle does not have DV Dongle functionality. The DV Dongle has an AMBE chip and the DVAP uses the AMBE chip in your radio.

116. Is a DVAP an Auxiliary Station?

Yahoo group: DVAPDongle
Date: 2010-03-25 20:19:08 UTC
From: kn4aq
Topic: 116 Message: 116

Here's something to chew on: is the DVAP an Auxiliary station:

(7) Auxiliary station. An amateur station, other than in a message forwarding system, that is transmitting communications point-to-point within a system of cooperating amateur stations.

or... not?

In reality, this is a self-declared kind of thing, as the definition is really broad (until the FCC tells you different, which usually takes one of our more thick-headed members to push the issue with them. And by bringing it up here, perhaps I qualify, but I'm not going to ask them directly).

If you think it might be an auxiliary station, your frequency choice is somewhat limited. You can't operate below 144.5, or between 145.8 and 146.0. Most of that spectrum should be avoided anyway, but it's just something to think about.

Hi Mark. To link to a repeater or reflector, place the callsign of that system in the first six characters of the urcall field. Then put the target module in character seven and "L" in character eight. For example, if you want to link to W4DOC module C, use "W4DOC CL" in urcall.

From: Beischel
Topic: 121 Message: 121

Got the DVAP yesterday. Originally had it set-up on a Windows machine I use as web/mail server in the basement office.

This morning I decided to see how it would work connected to an eeePC (original 701, but with Ubuntu OS). The eeePC is connected wirelessly to the home network.

To my surprise (only because of the little Linux laptop and wireless Ethernet) it seems to work OK. Connected to the 030A reflector and chatted with KJ4VO and W4CPU in Atlanta.

Hi Rich. There are a few things to check. First, is the "lock callsign" box checked? If so, is the mycall field in your radio matching the station callsign in DVAPTool? Second, what does the text window show when you key up and nothing shows in the dvaptool graphics window? There is a lot of good debug info there. Third, you might try changing the frequency in dvaptool by 1000 Hz in either direction and key up (don't change your HT frequency). It might be that your radio and the dvap are slightly off frequency. Fourth, run the lowest power you can on your HT. You might be overloading the front end of the dvap.

Hi. The files are built into the binary. You do not need to "find" them. Simply follow the instructions at http://www.dvapdongle.com to create new ones. DVAPTool looks for the new files first and falls back to the embedded ones if none are found.

Robin,
Is it possible to record a file for each connection you might make?
Like "connected to REF001" or "connected to REF002" or is it just connected and disconnected?
If you can do multiple recordings, how does it know to tie the specific recording to the correct reflector etc..?

Thanks,

Patrick

Hi Patrick. The connection message is generic. You cannot record one per gateway/reflector. That could change if people want it.

Have you noticed that when you unkey you see a text message with the status? You can see the connected reflector/gateway that way.

Date: 2010-03-29 20:26:53 UTC
From: Julio Peralta
Topic: 133 Message: 133

Just received my new DVAP and been having a lot of fun with it. I have one question; I read where if you have the lock callsign box checked no one else can xmit through the DVAP. However if its not checked can others use it like a low power repeater and whose callsign shows up at the gateway the one that is in the Station Callsign field in DVAP Tool or the callsign of the station xmitting through the DVAP?

Julio, W4HY

Thanks Robin,
So I record the file I want and it is saved as dvaptool.dvrec, then I rename it to say alreadylinked.dvrec the do the same process for the rest of the voices, is that correct. Also will they go into the binary also or can they be found in the same folder that the dvaptool is in?

Thanks,
Larry

From: Don Shelton
Topic: 131 Message: 135

When I first started testing the DVAP (in the same room) I found that I needed to get the device as far away as possible from my handheld. If it was too close, it would not transmit. (Green LED flashes) Could not seem to get that symptom to change with squelch control. i.e. too much antenna when very close. My first couple of QSO's dropped until I figured out what was happening.

However! This may be the happiest I have ever been after making a "radio" purchase! It works extremely well and gives new life to my 91AD handheld.

Hi Larry. That is correct. Also, the recorded files are not incorporated into the binary, they are read from the starup folder. That makes it easier to get back to "factory defaults" if needed by just removing the files.

Hi Ted. DVAPTool does not, by default, log to a file. You could start it from a command line like "DVAPTool >dvaptool.log 2>&1 &" and it should save the output to dvaptool.log. I'm considering adding the ability to log both to a window and to a file.

151. DVAP Test

Yahoo group: DVAPDongle
Date: 2010-04-02 02:42:41 UTC
From: k1lva
Topic: 151 Message: 151

Good evening to all. This is a bit of a crazy request, but I havent been able to reach anybody on any of the reflectors or repeaters. I registered my DVAP on the gateway that I have the rest of my equipment registered on. The call I registered with does have an "A" in the eighth character. I can connect and disconnect without problem, and transmissions seem to be getting through, but nobody answeres.

So if anybody has any info, or is around on ref001C, I would love to hear from you.

Topic: 153 Message: 154

Hi bc660. :)

The squelch is used only when voice packets are received without a matching header to proceed them. I usually watch the noise level from the received signal meter and set the squelch half way between the noise peak and the max level.

If you are connected to the Internet when you plug the DVAP first in, and you haven't disabled driver downloads from the Internet, then I believe that you should have downloaded the drivers automatically. It's work for me on both x86 and x64. You might try going into device manager and doing an update on the device's drivers.

161. Broadcast Mode

Yahoo group: DVAPDongle
Date: 2010-04-07 00:19:12 UTC
From: Mel
Topic: 161 Message: 161

Robin, et. al.:

Just got my DVAP from UPS and got it on the air immediately. Works great! One question though...

We have a still-limited community of local RF users on W7AES, so some of us have taken to using the "broadcast" mode as a temporary standard configuration by loading W7AES in the UR field with no modifiers. Those who have only 1.2 GHz can talk to UHF and VHF simultaneously, etc.

I don't think this works with the DVAP. Is there any possibility of using a DVAP for multiband broadcast?

Thanks,
Mel K6UV

p.s. - I scanned the postings and didn't see this subject. Hope it's not a dupe. 73.

Topic: 161 Message: 163

Hi Mel. The simulcast mode is a function of dplus on the gateway. It currently only listens to the RF side coming from the controller/repeater module for commands like simulcast. It is possible to enhance dplus to allow for dvap/dvdongle commands but that would require coding on both dplus and the dvaptool software.

It is possible to enhance dplus to allow for dvap/dvdongle commands but that would require coding on both dplus and the dvaptool software.

171. DVAP

Yahoo group: DVAPDongle
Date: 2010-04-08 02:30:01 UTC
From: k1lva@yahoo.com
Topic: 171 Message: 171

Hi Robin!
I've had my DVAP for about a week or more! I love it. I'm in the Boston area and there aren't any Gateways in the area yet? This puts one in my house! Couldn't be any easier to set up! I did notice that after the update on the trust server with the A initial, there was a little lag time from the time I entered the update, to the time I could actually pass audio.

After a couple of hours of pulling my short hair out, the DVAP began passing audio.
Is there a site with info on what the lights mean in the DVAP (for troubleshooting purposes)? And is there any way to get it to make an hourly announcement like the gateways at the top of the hour?

FYI, I'm getting about a 2 mile range with a Comet CX-333 at 100ft ASL. Thanks for your time! Love the DVAP!! 73-Jarrod

Hi Jarrod.

I'm working on much more detailed documentation for the DVAP. I'll make an announcement here when the web site has been updated.

There are four lights, green, red, yellow, and blue (in that order from left to right). The green light slowly pulses when the DVAP has been connected to a PC/Mac and the drivers are installed properly. When DVAPTool is connected, the green light switches to show receive activity. The red light shows when the DVAP is transmitting. The yellow light shows when there have been lost packets from the internet during a transmission. The blue light shows USB activity from the PC/Mac to the DVAP. You should see the blue light blink about once per second when connected to DVAPTool. That is the keepalive packet.

From: Al
Topic: 174 Message: 174

Hello to the group...

I have had a ID-800H for some time now but never used it in "DV" mode to no D-Star repeaters in my area. After seeing a DVAP demo at a recent hamfest, I ordered one and have it connected... So far, no luck with much... That said, I KNOW it's pilot error on my end. I am registered in the D-Star system and have programmed in the call of the repeater I am registered through. I have all of "MYCALL" data entered into the ID-800H and have several callsigns of D-Star users entered in "URCALL".

I can "LINK" to the repeater system I am trying to use, but when I make a call, I just get a voice message stating that I am linked to the system. What am I doing wrong here?

Hi, Al,

My first guess is that you're overloading the DVAP with a strong signal from the 800. I've tried using mine in my car with my 2820 at 5 watts, and I find it works - or doesn't work - somewhat like you describe. But with my 92 handheld at 100 mW, it's prefect.

So try moving the DVAP 20 or more feet from the radio, or using a dummy load. If it starts working, that's the problem.

From: Steve Garwood
Topic: 177 Message: 177

Hello!

I'm just getting the DV/AP set up - when I try to link to a repeater according to the sheet, using the call sign xxxxxxAL, it is showing linked R/O with a "receive only" message.
I know I probably don't have something right - not sure what....

Anyone?

Thanks

Steve, N0CZV

Hi Robin...

Tnx for the reply...

Still no luck... I seem to get lots of "garbled" audio, which tells me someone is talking, or calling me. They can't hear me and I can't hear them... Sounds like R2D2 sounds... I read something about that but can't seem to find it now...

Hi Steve. Are you using "N0CZV " in the station call? That is the only callsign/terminal you have registered. The remote gateway will not let you transmit if the callsign/terminal is not registered.

Robin,

I had my call on the DVAP listed as N0CZV? A .? When I took the A off the end, it started working late last night.? I was able to make a contact on WB8I.? I wasn't able to find any reference to R/O other than the mention of the voice file that was stored...

I also had switched antennas to a Diamond gain SMA - When I was a couple of feet from the DV/AP, it was making the connection intermittent and the audio garbled.? I switched back to the original antenna and it cleared right up...

Getting the hang of it - entering callsigns and commands into my 92AD memory slots to scroll through.? Not seeing any of the disconnect issues between the box and the computer like I have with my DVDongle....

The DV/AP looks like a winner!

What is in UR call on the HT?

You have to have program (Memory channel)?to LINK to the repeater or reflector like WA6IRCCL

?

And then you need to?have one that is CQCQCQ so after you link up you can talk

And then you need an unlink like WA6IRC U

?

All of them SIMPLEX

?

Does that make sense?

Hi Gary...

First off, you were "dead on" about over driving the DVAP... I found that out after I was finally able to hear and talk to someone...

My problem with not being able to hear or talk to anyone was another issue entirely... It seems that I was missing the very last step in the programming process of the ID-800H when going to "CQCQCQ". Once I got that figured out, I was able to hear people on the system I was linked to. The over loading problem came next...

I have a friend who was also new to the DVAP and he suggested the over loading issue to me...

BTW, I was veiwing some of your videos in hopes of maybe learning more about the ID-800H...

Thanks again... You were dead on...

Steve,

I live up in Canada and 2 weeks ago I was able to link to many reflectors and repeaters with my DV-AP --- except my local DStar repeater which was on the gateway. I was told by a very knowledgeable local ham that the local DSTAR repeater was running an older version of software that would not acommodate linking of the DV-AP yet DV Dongle users were unaffected. A few days later the repeater managers updated the software at the repeater ....et voila....I could link up via DV-AP! So I suspect that it might be a similar issue which you are experiencing.

I live just north of this repeater and from what I have been told, it's in a guy's garage. Supposedly it's going to be moved to a real tower either in Hopkinton or Westborough MA at some point in the future. I don't believe the current owner has it linked up as a gateway. I'll see if I can find out any more info.

it does have a gateway and is occasionally linked to reflector 10. They probably don't let the users link or unlink

191. DVAP Reflector

Yahoo group: DVAPDongle
Date: 2010-04-13 06:22:13 UTC
From: mark
Topic: 191 Message: 191

At the risk of opening up a can of worms. Are there any dedicated DVAP/Dongle reflectors out there?

Just a place where DVAP/Dongle users can connect to without disturbing RF systems.

Just a thought.

Thanks again Robin.

192. New user - R2D2 audio

Yahoo group: DVAPDongle
Date: 2010-04-16 01:53:21 UTC
From: Greg
Topic: 192 Message: 192

I'm connecting to the remote fine, however I get garbled digital audio regardless of distance from the module or power setting. I've been 10 feet to across 300 feet away and adjusted the power from low to high on both the module and my 91AD. Clearly I'm missing something here. Any ideas?

Also, on recorded audio and playback, it's the same.

Thanks,
Greg

Hi Greg. When you run the "I" command (urcall "DVAP I"), do you also hear garbled audio? Do you have a second D-Star radio that you can try? Can you try it out at a different location?

Some possibilties: the DVAP is not working properly, you are in a high RF environment, the D-Star radio is not working properly. As unlikely as it seems, we've seen one case of an HT that just did not work.

Feel free to send an email to me directly and we will replace the DVAP if it turns out to be the problem.

194. DSTARInfo Dayton Anniversary Edition - Call for Articles

Yahoo group: DVAPDongle
Date: 2010-04-16 18:09:47 UTC
From: Woodrick, Ed
Topic: 194 Message: 194

It's just about here! Dayton and the first anniversary edition of the DSTARInfo Newsletter. This issue of the newsletter is being expanded to allow for even more great stories and information about D-STAR. That's where you come in.

We need more stories!

Our standard article is only about 300 words long. Not much longer than this email.

* Tell us what you club has done with D-STAR.

* What events you've used D-STAR with. Send us the stories so that we can include them in the newsletter.

* There's a lot of new things in D-STAR since Dayton last year, tell us how you've used them.

* Are you proud of your new repeater? Tell us about it.

* Hints and Kinks? We've got a place just for them.

Send your articles to articles@...<mailto:articles@...>
If you are thinking about creating an article, please drop us a note as soon as possible. We need to get all articles in ASAP.

Thanks,

DSTARInfo News Letter Team

195. DV/AP and Dongle USB cables

Yahoo group: DVAPDongle
Date: 2010-04-16 21:56:32 UTC
From: Steve Garwood
Topic: 195 Message: 195

I thought I would hook up my shorter DV-Dongle cable to the DV/AP for use on my netbook computer for more portable operation.
I was not able to open the DV/AP with the application with the short cable connected.
Don't know that much about the USB cable protocol - Am I to assume that these two cables are pinned differently?

Thanks for any clarification.....

> I thought I would hook up my shorter DV-Dongle cable to the DV/AP for
> use on my netbook computer for more portable operation...
>Steve, N0CZV

One reason for the longer cable is to put some distance between the DVAP and the computer. The DVAP has a receiver (duh) and computers are notorious generators of low-level RF junk. That extra couple of feet reduces any noise the DVAP gets from the PC.

As far as the short cable working - I just plugged my DVAP in using the Dongle cable and it worked fine.

I had a similar problem with the short DV Dongle cable. Found that the cable was defective and causing the drop outs. When I held one end of the cable and wiggled it back and forth, the Dongle would drop in and out. Throw away the short cable and use the one with the DVAP for both and you should be good. If you want a short one, Newegg has them for sale, but the longer one would be better for the DVAP to get it away from the noisy computer.

I haven’t seen one that won’t work yet.

But as with any computer, memory, processor speed, and disk speed all will effect performance. Don’t skimp on RAM.

From there, stability is based upon what else you install on the system. But a lot of crap and it will normally work like crap.

I am using an HP MDX16 it is Intell based and windows 7. Dont think there is an issue there as the drivers loaded and the dvap tool shows the ap number and when I key the 880 I see the red bar go up on the dvap too

Thank you all
This is the group that has answered any of my questions so I now know that I am registered.
I am set to simplex and low powwer FM.

I get the Blue keep alive light on the DVAP. I have not seen the red light.
I am also not sure which call sing to enter as 4 are registered.
Do I need to be able to reach the repeater that I am registered at?

It looks like the DVAP tool is functioning?
I would assume that if all is hooked up I should at least hear traffic.

Make sure you have your radio in simplex "DV" mode.
I had to change my simplex frequency as well before
Mine would work.

> for a while.

Yes, you can monitor either a repeater or a reflector for an extended period, though you may get "booted off" either one now and then. I don't know exactly why that happens, but I suspect it's a brief loss of Internet connectivity somewhere along the line. If that happens, the DVAP will announce it to you (Remote system unlinked). A DVDongle will just be disconnected (you'll hear the loss of "Comfort Noise" if you leave that on).

If you want reflector traffic, it's better to connect directly to the reflector than to a repeater that's connected to the reflector.

The main reason is bandwidth. Each DVAP or DVDongle connection uses at least 25 kbps of upload data from the reflector or repeater server. DVDongles get the data from all three ports, so the load can be close to 100 kbps if all three are in use (Robin - does the DVAP get all three port's data, too?).

Reflectors are designed to handle dozens to hundreds of connections. They're usually located at big data centers and have 10 Megabit or better Internet connections. Repeaters can only handle a few connections. They usually just have a cable or DSL connection with a limit of a few hundred kbps upload data. The DPLUS program running at the repeater defaults to accepting only four DVD/DVAP connections at a time.

So if you want to talk to the local guys on a repeater, connect there. But if the repeater gets a lot of DVDongle/DVAP traffic, maybe you shouldn't hang out there unless you know it has a bigger Internet pipe and has been set for more connections. If you just want to be entertained by the traffic, pick a reflector.

If you have a DSL modem that has a firewall, set it to Low Security. Hopefully you know how to
access the DSL modem thru its IP address.

When I set the level of my Firewall to Medium or Maximum on my DSL Modem I get no traffic thru the DVAP.

Mike WB6DJI

Try turning off your firewall just for a short test
You may be blocked out by a software or hardware firewall.

Hi Mike. This is surprising. The DVAP communicates to gateways/reflectors on UDP port 20001 for both connections and voice traffic. If your router was blocking the inbound traffic on that port, you should not be able to connect. Are you receiving the "remote system linked" message but then no voice traffic?

The connection to a gateway/reflector receives traffic for all of the ports on that system. You will see messages in the log when folks key up on a module that you are not connected to and you will not receive voice traffic. That is normal. The thing to watch is log messages showing the module with which you are connected.

IT WORKS...
AND SO DOES THIS GROUP.

I have been on a lot of groups when I am trying to figure out the "how and why". I have never been to a more professional and responsive group ever.

The replys and suggestions were excellent. Even with all of that it was the expertise and caring of Tim Barrett by phone and computer and Brian Frobisher Wa6JFK on the air. It is the dedication of the folks here that will help Dstar grow into the valued mode it should be.

I hope as my skill and knowledge advance that I can help someone in the same boat.

The issue was not the DVAP or it's setup which is very straight forward. It was my understanding of the protocols required to connect to reflectors, FM versus DV in the database and a bunch of other newbie issues.

Thank all

236. DVAP in action - weird results

Yahoo group: DVAPDongle
Date: 2010-05-03 02:35:10 UTC
From: flingitman
Topic: 236 Message: 236

I was visiting a friend out of town this weekend, out in Rancho Mirage, CA.
Was able to work the K6IFR DSTAR repeater on 92AD but also brought DVAP and was connecting around, had a QSO on a reflector at one point so I know it was working.

If on HT and listening to K6IFR with RF I was hearing it must have been connected to a reflector, lots of chatter etc....

But then when I connected via DVAP.....silence...did not hear chatter.....same port B etc.

In fact I heard nothing on any reflector I connected to via DVAP, but I did work an OM via DVAP at one point.

237. DVAP feedback from Geelong - Australia

Yahoo group: DVAPDongle
Date: 2010-05-03 11:06:20 UTC
From: Nik Presser
Topic: 237 Message: 237

G'day all on the list,

Again, well done to Robin & Moe for the job well done with these little devices :-)

I've had mine since Easter and despite having a fair hammering, it hasn't missed a beat. It has been pretty well 100% reliable. I've also got a DV-NodeAdapter into an IC-208H as a Hotspot and it's a bit hit and miss sometimes, but the DVAP is good to go!

Using the supplied 2inch antenna, the DVAP with a portable like an IC-92AD is good for about 150metres and with a mobile about 250metres. With an SMA connected 1/4wave, the portable range is about 400metres whilst mobile (IC-2820H) range is about 700metres with the DVAP sitting on the window sil at home. I haven't tried it into a decent mast-mounted antenna yet, but I've been told it should be good for 2 - 3 km. Adrian VK4TUX has been very helpful with advice on the DVAPs in Australia.

It cross-bands nicely through an IC-2820H which should give the DVAP some nice potential uses. Ideal for those that aren't up to constructing a DV-Node Adapter or Hotspot.

A few things for the wishlist Robin, mate, buddy... :-)

- A 70cm version would be nice

- What about the option of a duplex freq set instead of the current simplex option? I run a 70cm D-Star repeater VK3RNP-B at home and would like to use a DVAP to link the repeater to the D-Star network instead of trying to get the HotSpot running at 100% reliability. This is an interim measure until I get a repeater gateway up and running - and a whole lot less hassle.

- Is there any likelyhood of DPRS running through the DVAP on a future version of the windows app??

Otherwise, well done on a very handy device. The DVAP has great potential on bringing D-Star to those in regional and remote areas that aren't within range of an existing D-Star repeater. Nice work!! :-)

Cheers,

Nik Presser

I left it on various reflectors for a few minutes at a time.

?

But maybe some long winded hams?

?

I am noticing a pattern.

?

When at work on our network here, the DVAP seems to "HEAR" lots of QSO etc on various reflectors.

?

It could be time of day that I am on, when at work it is 6:30am to 3:30PM PST and home is normal night hours PST

?

I am wondering if something at home is blocking the incoming audio from reflectors, even though I have held QSOs at home, but I never seem to hear "Banter" on the reflectors.

?

?

243. Dayton 2010

Yahoo group: DVAPDongle
Date: 2010-05-07 18:43:08 UTC
From: sadnesssmiling
Topic: 243 Message: 243

Does anyone know if the creators of the dvap dongle will have a booth at dayton?
And if so which booth number, i am interested in this product because there are no repeaters in my area.

Thank you
joe

246. New DVAP Dongle Installation

Yahoo group: DVAPDongle
Date: 2010-05-07 20:11:10 UTC
From: sitedev
Topic: 246 Message: 246

I received my DVAP Dongle from HRO last night. The packaging was terrific and contained a "Getting Started" sheet.

Qucikly looking at the sheet I noticed there was a blue URL to http://www.dvapdongle.com. I opened a browser and typed in the URL. I then printed the "Installation Instructions".

I followed the installation instructions and within 5 minutes I had the DVAP up and running. I am able to connect to Reflectors and Repeaters just fine. I experimented with a Verizon Prepaid Mobile Internet card and am totally impressed with the functioning and capabilities of the DVAP and how small the bandwidth requirements are. I let the DVAP run on a notebook for a few hours and did not experience any problems whatsoever.

Job Well Done to the person (Robin) or persons who made the DVAP a reality.

I am totally confused at the questions being asked when the installation instructions cover everything needed to install and operate the DVAP Dongle. I see some having a duplex setting when they should be simplex. I see some setting their radio to FM.

One just needs to ready and follow the instructions step-by-step and success will occur.

Thanks again for a great tool.

Jeff, congratulations on your new DVAP. You will find it to be the best thing since sliced bread! Link onto REF003C and you'll see a few DVAP's linked in Australia also.. :-)

Regarding following instructions, some people are born never to read instructions - but then often bitch & complain when it all goes wrong. But the DVAP's are very straight forward to install and get up and running.

Cheers,

Nik

Thanks Nik,

I think I am one of those who at first don't "RTFM", until I run into trouble. I already am enjoying the DVAP and am observing the popularity of it growing rapidly.

I have a D-Star repeater (W7SVD B) up and running for well over a year and couldn't resist getting a DVAP. I can justify it as I travel on business occasionally and sometimes there is no D-Star. J

73 and hope to hear you on D-Star,

Jeff

From what I can tell, the iPad USB port, like that of most phones is a slave device, not a master device. As such it won't work with the DVDongle or DVAP. There does seem to be a Camera Connection Kit available, which looks to be a USB Master, but at this time, Robin hasn't released any support for it, and I don't know if it is on the radar screen. Actually I suspect that the only thing on the radar screen right now is getting ready for Dayton.

252. How to confirm "getting out"?

Yahoo group: DVAPDongle
Date: 2010-05-11 22:25:50 UTC
From: Richard
Topic: 252 Message: 252

I just hooked up the DVAP, and so far no responses.

92-AD- simplex, check; DV-A, band B, check; registered with local gateway as wh6diq-a, check; DVAP tool same "my", check; freqs match, check.

UR= DVAP>>>I gets DVAP response; E "echoes" ok.

UR= individual (currently active) call at distant location, no response.
UR= /specific (currently active) repeater, no response.

in both cases, reading the log I see "ignoring transmit while not connected" and "unknown command" followed by the current data in UR.

Oh, and the lights, I have a slow blinking green, and when I open the DVAP tool it goes to blinking blue.

What's up?

thanks and 73's

Hi Richard. It sounds like you have not linked anywhere. Did you try linking to a gateway or reflector? Once linked, you need to use "CQCQCQ " in URCALL to talk to the remote system.

Richard.

When you start the program DVAP TOOL and then click on the OPEN button sometimes you have to click on that twice, you must see "Name DVAP DONGLE" and Serial # XXXXXX in the top right of the DVAP tool before it will take any commands, at least from my experience, this appears only after the splash screen with the "YOU ARE USING THE LATEST VERSION....."

If you don't see another "SPLASH" window about "Your using the latest version, yada yada yada" then your software is not working yet.

Also, what do you have in the CALLSIGN area

Try it without the A trailing your call, the gateway might not have that info yet.

Also make sure you have something like

REF003B L in the UR call and then to talk, make sure you have another "Memory" with the same SIMPLEX/DV frequency with CQCQCQ in URcall.

Let me know if I can help.

Richard,

Call Sign Routing does not work with the DVAP. To use the DVAP, you must link it to a repeater or a reflector.

Richard.

You posted this call for assistance hours ago.

I know that I responded personally and also via the newsgroup.

It is now 8:13PST PM

Did anything work?

If so, please post on the newsgroup..

If you fell alsleep, please let us know that also.

Any luck with the plethora of information provided?

Richard;

You cannot use Icom-style direct callsign addressing (UR=KC4YOZ) or repeater addressing (UR=/KI4WXSA) with the DVAP. You can only use D-Plus style linking commands (UR=KI4WXSAL) UR=" U").

Hope this helps.

Ken - KC4YOZ

I think you are indicating callsign routing? This is not supported by DVAP. You need to use linking commands 1st, then switch back to CQCQCQ.

> UR= /specific (currently active) repeater, no response.

Again this is not supported by DVAP. Use as stated previously.

> in both cases, reading the log I see "ignoring transmit while not connected" and "unknown command" followed by the current data in UR.

This is because no linking commands were used.

> Oh, and the lights, I have a slow blinking green, and when I open the DVAP tool it goes to blinking blue.

That's a good thing. Those are good light indications. See http://www.dvapdongle.com/ for linking commands using DVAP. If you have not done linking before, you can learn with the D-Star calculator at http://www.dstarinfo.com/Calculator/Default.htm

You can also call someone and ask. Tim has offered that service.

That would be good info to make REALLY clear on the setup instructions! I (and presumably others) would assume the UR would operate exactly the same as without the DVAP. I don't recall seeing anywhere that callsign routing would NOT function the same. Oh, well. That's why we have these great forums!

I just purchased a dvap at Hamvention 5/14/10, everything seems to work, but it will not communicate with the internet, did all the installation things and the unit communicated with my 92AD, lower right hand of the screen there is a clock and it is always all zero's, cannot receive any sigs. Any suggestions?

266. DVAP and reflectors

Yahoo group: DVAPDongle
Date: 2010-05-15 18:46:06 UTC
From: ka0iar_mike
Topic: 266 Message: 266

My problem is this: I can't seem to link to the reflector thru my DVAP. I'm too far from the repeater to hit it with an HT but the DVAP works fine. If someone has the reflector turned on through our club's gateway I can QSO with no problem. But if I link to the repeater and then try to link to the reflector (URCALL = REF030CL, RPT1: K0MDG_ _C, RPT2: K0MDG_ _ G) for example, I don't seem to be linked.

That's the REF they used for Dayton and it sure is quiet when I try to link and it was awfully busy a few hours ago so I assume the link dropped and I can't get it back.

Do I have it programmed incorrectly?
Any ideas?

Mike, KAØIAR

Hi Mike.

Make sure you are in simplex mode. Rpt1/Rpt2 should not be used in simplex mode.

don't put anything in rpt1 nor rpt2

you can't link to a repeater and a reflector at the same time.

the dvapdongle website has good instructions

I bought one yesterday and it's pretty neat. I have no problem linking and unlinking but I did discover that I'm not registered on the gateway as I can only receive.

Settings that worked for me.

YOUR:REF030CL
RPT1:KC8ZRM A
RPT2:NOT_USE*
MY :KC8ZRM

Hope this helps.

Jeff

I believe the reflector that's being used is REF030B. Not C.
So your settings should look like this to command the DVAP:

To connect UR: REF030BL
REP1 blank
REP2 blank
Then switch to this to talk once linked: UR CQCQCQ
REP1 blank
REP2 blank
Make sure the HT doesn't have a shift in it (simplex).
Hope this helps. -Jarrod

Make sure your radio is set up as Robin mentioned concerning the RPT 1 and 2 fields in simplex mode. The DVAP can only link to one gateway or reflector at a time. If you link to K0MDG C, that is your linked connection. If you want to link to a reflector, you must disconnect from K0MDG C and then link to the reflector. The way you worded your problem sounds like you are trying to connect to a reflector via K0MDG C.

Maybe I interpreted your statement incorrectly?

From: n8ics
Topic: 275 Message: 275

Just a updated reminder. If you have no green light after plugging the DVAP into the USB on your pc it is probably because your are missing the High Speed USB Driver. You should get the Installation wizard looking to Find New Hardware. Tell it to Search The Internet This Time for the files. It might take a minute but it should find it and begin installing it. If you have already exited the wizard you can go into the Device Manager to fix.

1. Right Click "My Computer
2. Click Properties
3. Click Hardware
4. Click Device Manager
5. Scroll down to "Universal Serial Bus Controllers"
6. You should see a "?" on the driver that is having problems
7. Delete the driver with the "?" on it
8. Click the "+" next to the "Universal Serial Bus Controllers"
9. Click "Action" at the top and "Scan For Hardware Changes"
10. This will start the wizaard again and let you try the reinstall of the driver. Make sure you let it search the internet for the driver.

Hello Jeff,

Make sure that you have the "A" in the eighth position or you will not get in. I had the same problem and I was told that you can use it without the "A". Try running it that way and if it works you are good to go!!

Good luck,

Bob N3PUG

Bill

If you go here.....

http://dvapdongle.com/

You will see that you can get DVAP dongle software at the following location

http://www.opendstar.org/tools

Nothing really new there, but maybe newer than what you have.

I also think that the DVAP software is checking everytime you fire it up as it says "you are running the most current version" etc and I don't think it would know that if it was not checking.

I have never had an update, what is at http://www.opendstar.org/tools is what I am running so hoping for some updates soon.

But I must say that the current software seems to work FB

284. linux 64-bit version of DVAPTool?

Yahoo group: DVAPDongle
Date: 2010-05-20 18:00:25 UTC
From: Bob Snyder
Topic: 284 Message: 284

Is there a flavor of DVAPTool compiled for amd64 under linux? I can't get it to start due to an issue with libgthread, and I suspect it has to do with my system being a 64-bit system and the binary being 32-bit.

Failing that, does anyone have other suggestions?

Bob
N2KGO

```

289. DVAP: Hamvention alittle confusion on REF001C

Yahoo group: DVAPDongle
Date: 2010-05-21 21:56:47 UTC
From: todd hartzel
Topic: 289 Message: 289

Greetings,
To the guy that was on REF001C about 1 week ago who was at Dayton or leaving Dayton, on the reflector suggesting/bragging that the 1.02 software/firmware was brand-new. He claimed to have upgraded at the Hamvention. I'm sorry to report, there is nothing new about version 1.02 of the software. I've had my DVAP since March, and I downloaded the 1.02 software a few days before DVAP arrived via UPS (again, in March). I don't remember what his callsign was. But obviously he was confused or perhaps just misinformed. And actually, I think 1.02 has been around since at least February, 2010.

I'm not trying to make that ham look like a fool, but he
was misinformed.

Future features...
I look forward to any new features/upgrades on the software.
The DVAP is a fine product, and works 100% as claimed. I have
not found any problems with it. I really appreciate the fact the
unit runs very COOL (in fact, no heat at all), and draws power
only from the USB port itself. And it does indeed cover more
than just my house. I could walk around in my neighborhood
and still use it with no external antenna attachment on it.

I am located only just slighty outside of the coverage zone of The
St Louis D-STAR repeaters - K0MDG). Well, HT range.
Hence, the reason for me to get a DVAP.

73 from n0vkg / Todd in St Louis, MO USA

290. help me get my head around this....

Topic: 290 Message: 290

hello all

tell me if i have got this straight

first thank you robin aa4rc for helping me "officially" register my call sign (i thought i was...long story) and thank you again for a great product!

ok i have a ic-92ad

i have 3 memories programmed for ex. reflector 24

first memory REF024CL i switch to this memory and key up the dvap reports back that i am linked

second memory CQCQCQ i switch to this memory and key up and now i can talk

third memory REF024CU i switch to this memory when i am done talking key up and the dvap reports back unlinked

this is what i used to make my first digital contact today
my question is... am i going about this correctly?
before i go and program in a whole bunch of what i do not need please advise

i am thinking i only need one CQCQCQ memory
and then 2 memories for each reflector or repeater one for linking and one for unlinking

thanks in advance for any advice
joe

Hi Todd. Actually, he was correct. You are refering to the DVAPTool version 1.02. He (correctly) was referring to the DVAP firmware version 1.02 which was released at Dayton.

We are testing an update to 1.02 now and hope to release a firmware updater for 1.03 this weekend. Stay tuned...

You really only need one "Generic" Unlink program memory also

with the U in the 8th position.

Subject: [DVAPDongle] help me get my head around this....

hello all

tell me if i have got this straight

first thank you robin aa4rc for helping me "officially" register my call sign (i thought i was...long story) and thank you again for a great product!

ok i have a ic-92ad

i have 3 memories programmed for ex. reflector 24

first memory REF024CL i switch to this memory and key up the dvap reports back that i am linked

second memory CQCQCQ i switch to this memory and key up and now i can talk

third memory REF024CU i switch to this memory when i am done talking key up and the dvap reports back unlinked

this is what i used to make my first digital contact today
my question is... am i going about this correctly?
before i go and program in a whole bunch of what i do not need please advise

i am thinking i only need one CQCQCQ memory
and then 2 memories for each reflector or repeater one for linking and one for unlinking

thanks in advance for any advice
joe

Hi Marty. This is a firmware update in the DVAP so it is not specific to any O/S. DVAPTool, which runs on Windows, MacOS, and Linux, will be updated to use the new features. The initial test tools are currently compiled on Windows but will be made available on the other platforms as well.

Greetings Robin,
Ok. Sorry I added to the confusion even more. No problem.
Cool then. I look forward to an updater. Now that I look at my own.
I do realize now mine says: 1.01 ; upon boot-up. My unit stays on
for days at a time, before each reboot.

Again, sorry for extending the confusion.

You have it correct except for the unlink. Just put a "U" in the 8th character, no callsign, and the you can use it to unlink from any repeater.

From: rickt33350548
Topic: 297 Message: 297

Hi,
I just got my DVAP up and running late last night.
I connect fine using my IC-92AD.
It seems to time out and I get a "missed keepalive from gateway" on the computer screen.
Is this something I can change?
Thanks
Rick T

Hi Rick. The missed keepalive message shows internet issues somewhere between you and the system with which you are connected. Causes can include:

1) flakey internet connection to your ISP
2) flakey router (we've seen a few routers that had to be replaced)
3) you are trying to use the DVAP with a WIFI or cellular data connection that is flakey
4) the system with which you are connected has a flakey internet connection
5) your family is downloading DVDs while you are active... :)

299. Squelch settings

Yahoo group: DVAPDongle
Date: 2010-05-24 02:17:30 UTC
From: pcs32@sbcglobal.net
Topic: 299 Message: 299

Hello,

I'm new to the DVAP (Love it by the way) and have a couple questions about the settings.

What is the proper way to set the squelch?

How much noise should I see? It fluctuates between one bar and 3 bars.

Thank you in advance and I look forward to chatting with you on the DVAP.

Looks to me like you have some wrong settings in your callsign area of your radio.

?

UR should be something like REF003BL? (That would link you to reflector 3 port B)

?

R1 and R2 are BLANK

?

MY would be WA6JFK (that is my callsign)

?

Hi Ken,
For DStar, the squelch is not very critical and can be set somewhere above the RSSI noise level and it will work fine. It is only used to keep from decoding noise and randomly burping some "R2D2" into the system.

As for the RSSI level, your 1-3 bars is about right. If it is more than half scale I would try a different frequency or move it away from the computer.

There is a little more info at the end of this page for the more technically curious or if you just need some help going to sleep :)

We are all new to the DVAP... except Robin.

>
> How much noise should I see? It fluctuates between one bar and 3 bars.

This will vary, dependent on your location, and any RF noise sources that may or may not be nearby.

> What is the proper way to set the squelch?

I set mine just a bit above the noise. Example, at my location, the noise fluctuates around 2 or 3 bars, or around -115dBm (give or take). I have my squelch set at -110dBm.

The noise level you see would roughly represent the noise you hear on your FM 2 meter radio when you open the squelch knob. And like you would set your squelch knob just beyond where it gates the noise, you would do similar on your DVAP.

Ok, thank you very much. I did see a particularly curious thing the other day and then began to worry about the squelch. I sat down at the computer and looked at the DVAP application and it said, "transmiting to REF014C" on the bottom left. At that point, it got me thinking about the squelch as I wasn't transmitting and I wondered how long it had been transmitting. Currently I have it set for...

-91db

and the average noise it reports is around

-109db to -114db

Thanks again for the information!

Hi Adrian,
The DVAP RF performance is all based on the Analog Devices ADF7021-N chip.
http://www.analog.com/en/rfif-components/short-range-transceivers/adf7021-n/products/product.html

Its maximum output power is 13dBm so thats the limiting factor.

To extend the range one would need not only a power amp but also a pre-amp for the receiver since it does not hear as well as an HT with a pre-amp. Add to that its IF filters are very simple so adjacent channel interference is an issue.

The DVAP does ok for its intended purpose for short range use. Trying to turn it into a high performance transceiver is probably more work/cost than its worth. Maybe a slightly higher power version with a decent preamp version would have some use to extend the range to a few miles but would probably get killed in an urban area with intermod and adjacent channel interference.

I don't believe there is any audio circuit in the dvap. It is just a tranceiver. You could do it with a DVDongle.

Hi Jim. The DVAP is not a DV Dongle and cannot do the same. There is no need for an AMBE chip for the DVAP since the radio already has one.

the DVAP is a transceiver and has no way to produce any audio on it's own,
You need a dstar radio

The chip does about 13dBm but there is a funky Rx/Tx matching network and a low pass harmonic filter using small 0603 low Q coils so the actual output is closer to 10dBm. Selecting +10dBm in the program runs the chip full blast so there's not much more to squeeze out of it.

From: n1otw
Topic: 315 Message: 315

HI all,
I just rebuilt my laptop that I used to use my DVAP with. Since the rebuild I have not been able to get XP to load the driver(s) for the DVAP. I follow the same directions as when I first installed the device on the same PC, but no luck. I am running XP Pro, SP3. Toshiba Satellite M20.

Any help would be great,
Thanks,

Pat, N1OTW

Hi Pat. That usually means that you did not have internet service when you plugged in the device. Try going to http://www.ftdichip.com and download the drivers for Windows.

Hi Jason. DPRS data is currently passed through when GPS data comes in from an RF repeater module to the gateway. Pete's DStarMonitor program picks it up and passes it on to the APRS network. Since your GPS data is not coming in through this path, it is not currently being picked up and forwarded.

There is a fair amount of work (cudos to Pete) involved in parsing the data and connecting to the APRS network for forwarding. I'm hoping to do this with a future release.

The speaker microphone for the 92AD works when you go through RF repeaters and gateways for sure.

Just at this point you won't show up on any maps if using the DVAP (yet).

If you will ONLY ever be connected into the network via a DVAP, or
unless you send GPS info directly to another station (via simplex), then
there would be no use for one.

329. The DVAP is a beauty!!

Yahoo group: DVAPDongle
Date: 2010-05-31 08:21:38 UTC
From: Nik Presser
Topic: 329 Message: 329

G'day Robin and all on the list...

I've had the DVAP since Easter, it's been a ripper since day one and hasn't missed a beat despite some fairly heavy use at times. I've taken it camping a few times and as long as I can keep the laptop powered, we've got D-Star access at our campsite.

The DVAP continues to get excellent reviews... http://www.eham.net/reviews/detail/8802

It's RF range is excellent for what it is. It travels in the laptop bag everywhere I go - it's just so portable. And as our 3G coverage is very good in Australia, we can provide global D-Star access from just about anywhere.

I assume these are still selling like hot cakes!!

Robin, any more thought on a 70cm version yet? A few of us in VK3 have been talking about a 70cm version lately - we'd certainly love to see one. You know we're an impatient lot!

Everyone seems to be asking about the DVAP... :-)

Keep up the great work.

Cheers from Australia!

331. need info re callsign lock

Yahoo group: DVAPDongle
Date: 2010-05-31 21:01:37 UTC
From: wh6diq_richard_in_honolulu
Topic: 331 Message: 331

If lock is not checked, others can access my hotspot, yes? Does this pose a risk to A) my computer files; B) my license; or C) my DVAP (can, for example, frequency settings be changed?)?

I'm loving the DVAP, just discovered I can hit it from several blocks away (in the city) if I connect a magmount and stick it on the fridge!

One other general comment, I have found that when I'm in the same room as the DVAP with my 92AD, I MUST drop to low power to transmit through the DVAP, otherwise either nothing or r2d2 goes out...just an fyi that's not in the manual :)

Hi,

I picked up a DVAP at Dayton and it's been alot of fun. There are 2 things that I would like to be able to do and not sure if ver 1.02 supports.

1. if there was a time stamp at the beginning of the "new stream" line in the DOS window and the "Transmit state (OFF)".

2. is there a way to log the DOS window contents to a file?

Is there a way to do these in the software? If not would they be somepl to implement? They sound pretty simple and might be nice to haves.

Just a thought...

Thanks,

Jeff

Topic: 334 Message: 335

Hi Jim. It sounds like you are experiencing internet issues between you and the system with which you are connected. When you key up, five copies of the header which identifies you and your stream are sent to the remote system. This creates a stream cache on the remote so it knows how to route multiple connections. If all five of the header messages are dropped over the internet, that stream cache entry is not created and thus you see the "missing streamcache" message.

One thing you might try is to do a power cycle on your internet modem. We've seen some cases where the modem just gets flakey over time.

Actually don't forget that if you are connector to a reflector or a repeater, the GPS information will be sent to everyone listening.

A couple of reminders in evolution...

The IC-92 was available for about a year before the DVAP was introduced.
Icom doesn't support ANY of the DPRS to APRS gateways, that's all Pete's doings.
None of the Japanese repeaters have Pete's software running

And always remember, there's seldom a great reason why you need any Amateur Equipment.

You can log the DOS window to a file using standard DOS output command. Instead of starting the application from the icon, open a command prompt window first and in the directory where the .exe file is use the command example:

C:\>DVAPTool-1.02.exe >dvap.log

If you want more information:

C:\>DVAPTool-1.02.exe -debug >dvap.log

Should also be able to view it in real-time using something like "baretail" pgm. Kinda like the Linux "tail" prgm.

You can log the DOS window to a file using standard DOS output command. Instead of starting the application from the icon, open a command prompt window first and in the directory where the .exe file is use the command example:

C:\>DVAPTool-1.02.exe >dvap.log

If you want more information:

C:\>DVAPTool-1.02.exe -debug >dvap.log

Subject: [DVAPDongle] Re: DVAP transmitting problem

Hi Jim. It sounds like you are experiencing internet issues between you and the system with which you are connected. When you key up, five copies of the header which identifies you and your stream are sent to the remote system. This creates a stream cache on the remote so it knows how to route multiple connections. If all five of the header messages are dropped over the internet, that stream cache entry is not created and thus you see the "missing streamcache" message.

One thing you might try is to do a power cycle on your internet modem. We've seen some cases where the modem just gets flakey over time.

342. New firmware and utilities released

Yahoo group: DVAPDongle
Date: 2010-06-03 22:51:16 UTC
From: aa4rc
Topic: 342 Message: 342

As announced at Dayton, new firmware has been released for the DVAP. This new firmware version 1.03 is newer than that released at Dayton so folks that upgraded there will also need to upgrade. The new features include:

Update to frequency locking algorithm that should help mobile users

2 meter band scanner for help locating the best operating frequency

TX relay driver for the onboard header

FM transmit/receive with DTMF decoding

Moe Wheatley (AE4JY) has made a firmware update program available for Windows. He also released test programs for the 2 meter scanner and FM mode. Take a look at the readme file on the Downloads page at http://www.dvapdongle.com for instructions on downloading and using the programs. Note that the functionality provided by these programs will be added to DVAPTool soon so that users on all platforms may use them.

The DVAP utility program also has a frequency calibration capability. Be very careful if you use this as you can detune the DVAP if you are not using an accurate frequency counter or station monitor.

We hope to use the FM features with Echolink some time in the future. For now, it is just something interesting to play with. :)

Topic: 344 Message: 344

Here's a reminder on D-STAR activities at the Atlanta Hamfest for this Saturday.

* The D-STAR Forum is scheduled for 9:00am in the Forum area of Building B. There will be something for all D-STAR users from beginners to experienced users, including an update on the Georgia D-STAR Network and information on D-RATS, the premier data communications tool for D-STAR.
* Georgia D-STAR will be located at tables 75 and 76 in Building B just outside the Forum area. D-STAR, DVAP and DV Dongle information and the latest edition of the DSTARINFO Newsletterwill be available in the booth.
* KJ4BDF B repeater will be in operation on 440.7250+ and on display in the booth.

The Hamfest runs from 8:00am - 3:00pm on Saturday at Jim Miller Park in Marietta, GA.

346. Issues with DVAP V1.03

Yahoo group: DVAPDongle
Date: 2010-06-06 17:35:40 UTC
From: Dale Grant
Topic: 346 Message: 346

Was wondering if any one using the new firmware version of DVAP 1.03 are having any issues?

I seem to be hearing a lot more R2D2 that I had before. Also when I am transmitting I seem to be dropping out during my transmission at some point. Many times when I unkey someone is already talking.

Also can I get the older firmware version 1.01 somewhere as I would like to try to confirm my findings?

Thanks

Dale / VE6CPK

I recently upgrade the DVAP from 1.02 to the 1.03 released on the
Internet the other day. I have not seen any differences between
the two in my usage.

> Also can I get the older firmware version 1.01 somewhere as I would

349. DVAP

Yahoo group: DVAPDongle
Date: 2010-06-07 23:14:40 UTC
From: JAMES
Topic: 171 Message: 349

I purchased a DVAP at Hamvention, while using my IC92AD on lowest power setting in close to the DVAP, I was receiving reports of drop out and R2D2, fixed the problem by wraping DVAP in aluminum foil and placing a one loop turn ferite core on the USB cable nearest the DVAP. Seems that DVAP is easily overloaded even with a very low signal, also had problems using a gain antenna on DVAP, went back to supplied antenna for a no problem solution.

From: rmeiring@iinet.net.au
Topic: 171 Message: 350

Hi James,

What an brilliant idea to use a piece of ferrite. These USB cables indeed radiate quite a bit of noise. The aluminum is also a very practical approach also on how to attenuate the signal. I don't think we have to worry much about the VSWR caused by the effects of the aluminum attenuator as such low power levels.

The ferrite would be a good suggestion for the manual [which I must admit haven't read :-)]
I also wondered why the DVAP doesn't have a two diodes on the RX input to limit strong signals.
But perhaps this idea has been tested by the developer of this brilliant piece of gear.

I suppose one could also test a 10dB SMA attenuators if you just want to use it in and around the shack.... but I will put a nail in the wall and hang my DVAP on a piece of string so it is a bit further away from my PC. I will also do 2 turns with my USB cable around a piece of ferrite.

Which frequency to use for the DVAP. I guess that rather using the standard freq one could also a hand held radio to see which one doesn't have a birdy from the PC or other gear in the shack.
That might also help to improve the signal to noise ratio and as such help to reduce QRM/R2D2 related problems. Remember that the PC is not the only source of QRM in the shack. Modems and other electronic gadgets can produce also quite a bit of QRM on our 2m band.

Always a happy chappy with this piece of gear. Thanks for the suggestions on how to use it.

Hi Ken, Dale VE6CPK here. I was listening to Connie"s net last night and was getting a lot more R2D2 than normal. Also there seemed to be a little blurb, squeak, or a brief R2D2 sound every 15 seconds or so. I was also listening to it on our local repeater and noticed it to be muck better. I would like to go back to version 1.01 and see if I'm getting the same results just to confirm my findings. I do not think it is my internet connection as I do have a broadband high speed connection in both directions.

One more thought is that a couple of us locally have upgraded and have noticed that our transmission are dropping out now and then. So now I have a tendency to keep my transmission a little shorter.

Anyway I use mine a lot and either hope for a solution or maybe revert back to version 1.01 for now which I am not sure where to get at this time. Maybe someone can help with that.

I use my net book with windows 7 and also on my main computer running XP Pro. Both are having same results.

Thanks

Dale

Hi Dale,
Do you see this problem when in "echo mode" (UR == DVAP E)? This will help isolate a dvap problem from a network problem since the echo mode just loops back locally.

Much easier than that! Go to the web site and grab the latest downloads ... there is a nifty little utility that will display the RF spectrum - can show the whole 2m band or zoom right into a given frequency. Also has peak hold - so just fire it up and see where its quiet.

I would suggest also paying attention to the band plan for your area when shoosing a "open" frequency. Just because you don't hear something there, doesn't mean that freq isn't being utilized for something that you might interfere with.

Having same issue here. Connected to K0MDG C and B yesterday and constant issues all day with audio dropping, R2D2, not hearing other stations at times, and them not hearing me at times. Very annoying.

I have a business grade internet connection with 1.5 up and 10 down. Bandwidth here is not issue.

Echo test works just fine.

361. FCC required station ID?

Yahoo group: DVAPDongle
Date: 2010-06-10 03:27:42 UTC
From: n7xah
Topic: 361 Message: 361

Hi,
as a new member of this group and new DVAP owner, I was wondering how the FCC required station ID is handled in the DVAP. So far I have not seen any indication on-air or on the computer that the station operator call is transmitted locally on the air.
So do we need to ID the DVAP ourselves or would it be possible to implement some form of ID in the software?

Thanks and 73,
Achim N7XAH/AAR0AD

Hi Achim. The DVAP should be ID'ing every time it transmits just like a repeater. As a result, you don't need periodic ID messages.

I am thinking that when using DSTAR of any kind, you really don't need to voice ID as it is like Packet Radio, your callsign is included in each transmission.

?

?

365. DVAP connects to repeater Recieve Only on one repeater and not another

Yahoo group: DVAPDongle
Date: 2010-06-10 21:22:27 UTC
From: Louis
Topic: 365 Message: 365

Hi all,

New to this particular group! Just got my hands on a DVAP. Wow! Really cool device.

Just so everyone knows, I did a search on this question before posting.

I am admin for two repeater stacks here in Orlando (K1XC and W4PLB). When I connect to K1XC the DVAP works great. When I connect to W4PLB, it only connects receive only. Having trouble wrapping my head around the fact there is no problem with one and a problem with the other would logically lead one to suspect a problem with the W4PLB gateway. However, I have used a Dongle on PLB and others are using DVAPs and Dongles just fine on W4PLB. This would lead one to believe I have a local problem.

I just love this stuff. Any ideas?

Hi Louis. Watch the end of /var/log/dplus.log for the login message when you connect from the DVAP. Then check to make sure the exact callsign listed in that message is in /dstar/tmp/users.txt.

It is usually a syncing issue with the gateway.

Robin,

You hit the nail on the head. With a little help from N0XIA we did some testing and James found that without a suffix, the DVAP worked fine on both machines.

When I got back to my computer I checked the users.txt file on both systems and found neither system had my call with an A suffix. We only do registartions on K1XC. When I go to the registration page on K1XC I clearly see my call with an A suffix.

I have restarted services on both K1XC and W4PLB but still do not see my call with the A suffix in either users.txt file.

I still wonder why the A suffix works with one and not the other when neither users.txt contain the A suffix entry. Right now since I can simply use no suffix I have a workaround, but I do wonder if this is a sign of a sync issue that might cause problems somewhere else. It's a puzzlement.

I have this exact issue.

My dstar.local doesn't not seem to have other terminals from other repeaters and my local terminals are not pushed up.

371. How to call sign route.:link" to a distant repeater with a DVAP

Yahoo group: DVAPDongle
Date: 2010-06-13 20:53:13 UTC
From: dstarfanatic
Topic: 371 Message: 371

I am looking for the proper procedure to call sign route to a distant repeater using my DVAP. I guess we can't link to a repeater but can call sign route.
I am wanting to route/link to the Columbus Ohio Module C repeater W8DIG. I put "W8DIG C" in the URCALL field but do not know what to put in the RPT1 and RPT2 fields. I tried "W8DIG C" for RPT1 and "W8DIG G" for RPT2. I have tried the possible combination's.

Using a DVAP purchased at Dayton this May with the newer 1.04 firmware. I was getting sporatic disconnects with 1.03.Thanks for the quick fix Robyn.
Using Windows XP Pro, working great now with reflector linking.

Thanks for the help
73

Hi Steve. It is the other way around. You can link to the remote repeater but you cannot callsign route (at this time). Use the linking commands in URCALL as described in the online documentation at http://www.dvapdongle.com (i.e. "W8DIG CL").

Steve, it sounds like you want to link to W8DIG module C. All you do is put "W8DIG CL" in the urcall field. There is a space between the call and the CL. Never put anything in RPT1 or RPT2. This will link you to the repeater. Then switch the urcall to cqcqcq and transmit.

381. Display Problem!

Yahoo group: DVAPDongle
Date: 2010-06-14 09:47:16 UTC
From: db0df_freund
Topic: 381 Message: 381

Hello Robin, AA4RC!

Since last week I have a DVAP!
It works great...
But I have a problem with displaying the DVAPTool
on my notebook-display.
All setings I can do in the DVAPTool!
But it is all a little bit clinched. Not all characters will
be shown in the input templates.
The DVAPTool will not adjust automatically for wide screen displays.
Perhaps it is a interesting information for a next DVAPTool-Update!

Best regards - 73!

Markus, DH7CW

382. TX Dropping

Yahoo group: DVAPDongle
Date: 2010-06-14 16:34:05 UTC
From: Dale Grant
Topic: 382 Message: 382

Hello all, last week I was concern about hearing more RD/D2 on the receive side of the DVAP than normal, that has been corrected. However my other concern was having dropped transmissions.

There were 3 of us locally running DVAPs on the weekend, all with V104. We were all having dropped TX. It got to the point that many of us were doubling and having a big problem trying to communicate. We did the test on a local repeater and also via REF16C. Same results. Dropped TX is a little random usually about 20 seconds or more is required before it occurs. I was listening to myself coming back on our local repeater so I could tell when the drop occurred. When it occurred most times (not all times) there was a little data burst heard just before the drop however the DVAPtool on my computer indicated no problem, that I was still transmitting.

We all eventually went back to v101 and tried the same thing. No problem. We went on for a good 30 minutes and had no issues. Since then we have all gone back to 101.

I personally went back to 104 on a Sunday morning net with San Fran and Vancouver. The control operator keep telling me that he was seeing my call and just barely hearing my voice before it would drop. Worse than before. I was near the computer and could see that everything looked OK on the DVAP but apparently not. I quickly went back to 101 and when the call came around to me I checked in and was OK. I did 3 other transmissions before the net was over and all were OK (one for over a minute).

Is anyone else having issues or should I look a little deeper as to why this is happening.

I was listening to Connie's net Sunday evening and I have to say the audio sounded great. I'm not sure if others with their DVAPs were having issues with TX or not but I did hear some drops in there. Many chalking it up to possible bad internet connections.

So for now I will stay with 101 where I seem to have little if any problems.

Thanks to Robin for this excellent product as up here in Canada we have a lot of good cell coverage with internet tethering but few DStar repeaters and the DVAP certainly fills in those gaps.

Thanks

Dale / VE6CPK

Have you changed the default text size for your display? If so, that is what is causing the issue. This is not uncommon for many applications

Subject: [DVAPDongle] Display Problem!

Hello Robin, AA4RC!

Since last week I have a DVAP!
It works great...
But I have a problem with displaying the DVAPTool
on my notebook-display.
All setings I can do in the DVAPTool!
But it is all a little bit clinched. Not all characters will
be shown in the input templates.
The DVAPTool will not adjust automatically for wide screen displays.
Perhaps it is a interesting information for a next DVAPTool-Update!

Best regards - 73!

Markus, DH7CW

Once you have linked you need to have another entry that has cqcqcq in the urcall. RPT1 and RPT2should always be blank. See instructions at http://dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP.html

From: pjhor
Topic: 166 Message: 387

Execute dvtools and open.
set frequency to frequency used in all memory locations.
Call sign ending in a space and A
New call sign should be registered with the A.
I have 4 memory location set for control and OTHERS for reflectors and repeaters.
Freq is the same for all memory locations and all Reflectors.
Mode for all memory set to DV for all freq.
Name labels are: INFO, ECHO, TRAMSMIT, UNLINK, REF030C.
UR OR YOUR ARE: DVAP...I, DVAP...E, CQCQCQ, ...U, REF030CL, Respectively.
(.)= TO SPACE
each reflector in different memory.
REFLECTOR MEMORY UR:REF030CL. RPT1 AND RPT2 ARE LEFT BLANK.
set memory to reflector memory location and transmit.
Then switch to TRANSMIT to talk and when finished on the reflector transmit on the UNLINK channel or memory location.
PJH

389. USB-Port connecting?

Yahoo group: DVAPDongle
Date: 2010-06-17 05:36:33 UTC
From: db0df_freund
Topic: 389 Message: 389

Hello!
One more question!
My DVAP works great...
Three times (days) I use it.
But, I must connect the dongle two times if it works.
At the first time after connection the green LED is pulsing
and the DVAPTool says no dongle was found.
Disconnect and connect again the dongle! DVAPTool found the
DVAP. What is wrong? I had no problems with the installation.

Best regards - 73!

393. Reflector or DVAP timeout

Yahoo group: DVAPDongle
Date: 2010-06-17 16:55:04 UTC
From: kg8nn
Topic: 393 Message: 393

I often set up my DVAP to listen to a reflector more in a monitoring mode. I am using a Windows XP Pro Service Pack 3 computer with cable Internet access. I bought my DVAP at the Dayton Hamvention 2010. It was upgraded there to Firmware 1.03. I experienced many "Remote System Unlinked" unlinks. I have since upgraded to 1.04 Firmware and have fewer "Remote System Unlinked" states. I do however receive a few while just monitoring. Is there a timeout in the DVAP or the Reflector that would cause my DVAP/IC-92AD to disconnect due to non use?

P.S. I love the "Read DVAP Info" on the firmware updater. Could that feature be included in the next version of DVAP Tool as a click-able option or standard reading?

DVAP ing my nights and days away...

Hi ????. I didn't see a name in there.

The firmware does not play a role in connection timeouts. Those happen between your PC and the system with which you are connected. There have been a number of related posts here recently so you might take a look at them (i.e. message #298).

Also, have you tried clicking on "Help->About" in DVAPTool after you open the DVAP? :)

Hi Robin!
Yes, when I boot my notebook and the dongle is inside, it is the
same like you.
But I have the problem too, when I connect the DVAP after booting
my notebook - minutes later! Disconnect and connect again, then is
all okay.
At the weekend I will test all USB-ports from the notebook and from
the dogging station...(?)!
This morning I forgot the DVAP for testing at my office computer.

This is unfortunately a common problem as many programmers forget to allow for proper scaling of their forms for other than the default 96 dpi. I have had this occur many times, as with my ageing eyeballs I need to set the dpi higher and then captions do tend to become truncated.

Oh, if only programmers would test out their applications for visual usability better.

402. RE: [DVAPDongle] Re: keepalive from gateway

Yahoo group: DVAPDongle
Date: 2010-06-18 21:22:55 UTC
From: Dale Bryant
Topic: 166 Message: 402

Hi Robin,

Is there a way I can prove this? The reason I ask is that this connection is at work. We have two 10meg conections coming in to a FatPipe device that then goes through a cisco 5510 firewall. We never have connection problems with other locations (at least mostly not) that we allow a connection to. The FatPipe device is setup to load balance between multiple connections. The dongle will stay up until voice traffic starts then I will have problems with the keepalive. Is there any IP ports I should have open to make it more stable? I will take the system home and try from there. I thought it might be a CPU speed or memory problem as it is running on an old Toshiba M2 laptop running XP.

404. Over heating over power problem???????????

Yahoo group: DVAPDongle
Date: 2010-06-19 15:21:24 UTC
From: ronchap@att.net
Topic: 404 Message: 404

Last night while using the IC92AD with DVAP. We noticed that we started to drop transmissions when we moved inside the house from being outside. This morning we reduced the output power of the HT running only 100mw out and had many long QSO's without any dropouts.

I was told today that the DVAP dongle does not like strong signals and will overheat and shut off if to much power is used by the HT.

Has anyone else noticed this. Has there been any comments posted about this? or do I have a bad DVAP? Should I exchange it for another one?

Thankyou

I was having the same problem last night with V104. I was told this morning that I was running to much power into the DVAP from the hT.
I reduced the power to 100MW S-Low setting and the TX drops seems to have gone away. So, I'm not sure if it's a problem with V104 or some hardware issue.

I hope someone talks about this on the net.

Thanks
Ron /KA2HZO

406. DvapUpdater for firmware 1.02????????????????

Yahoo group: DVAPDongle
Date: 2010-06-20 10:07:50 UTC
From: ronchap@att.net
Topic: 406 Message: 406

Previously we have upgraded from Firmware 1.02 to 1.04 by downloading the FW 1.04 updater.
In trying to solve the TX dropping issues. We had then gone back to FW version 1.01 using the 1.01 updater.
We would like to go back to the FW version 1.02 that came with our DVAP.
But no DVupder 1.02 app is listed on the DVAP downloads web page,
Can anyone please provide us with the link to the DVAP 1.02 FW updater.

It's not listed here.
http://www.dvapdongle.com/downloads/

or anyolace else we can find it.

Thankyou
Ron

407. DVAP Receive Dropout Test

Yahoo group: DVAPDongle
Date: 2010-06-20 11:47:41 UTC
From: moe_wheatley
Topic: 407 Message: 407

A few users report some sort of DVAP receiver dropout and are advocating reverting back to previous versions from 1.04.
If indeed there is a problem then it woud be better to try and fix/resolve the issue than have everyone playing version roulette. DSTAR dropping out can be caused by a lot of things so a little targeted investigation is in order.

A few questions/suggestions for those reporting the issue to try and isolate it:

1. Use the Echo mode in testing. This eliminates your local network as well as the DStar network from the testing and isolates it to the DVAP and the PC.

2.Does the dropout occur doing long echo tests? You don't have to talk just key down for long periods then see if it echos back the same length of time.

3.If it does, then does the Green LED on the DVAP go out when the dropout occurs? The green LED indidcates the DVAP is still receiving data from your radio.

4. If it drops out, what is in the DVAP tool log screen when it occurs?

If there are no dropouts in the echo test, then the DVAP is happy and the issue is more likely a network or PC issue.

There have also been comments about overloading the DVAP. It can be overloaded but is not going to get hot and burn out. It is a low power device and running 5 watts near it and your PC is not a good idea for other reasons. I would be more concerned about getting RF into my PC cables and peripherals since they are not designed for high RF fields(not to mention your brain cells that are cooking when you have an HT antenna a few inches from your unshielded head) A few hundred milliwatts is all you need to operate within the DVAP's range. This also saves your battery life and keeps the HT from getting warm.

Another tidbit now that summer has come to the northern hemisphere, the DVAP(and your laptop) can become overheated if left in the sun in your car. The DAVP can move off frequency due to high heat and even worse, your laptop can overheat and malfunction. Best to keep out of the direct sun and make sure the laptop air vents are not clogged by carpet or upholstery.(learned the hard way with an Acer netbook :( )

Perhaps your 92AD was overheating and "DROPPING OUT"

I don't think the DVAP can overheat from being hit with a HOT HT.

Just curious. Why do you find it necessary to go back? I find the current release works great! If you share your issue with the current release, there may be another way to solve the problem. My usual policy with firmware is to never go backward.

410. Re: [DVAPDongle]1.03 and beyond!

Yahoo group: DVAPDongle
Date: 2010-06-20 13:16:56 UTC
From: k1lva@yahoo.com
Topic: 410 Message: 410

Since I upgraded to 1.03, my DVAP has seen increased amounts of drop out. I always run 100mw from the HT and the DVAP is on an outdoor antenna. Conditions here haven't changed since the day I installed it. It could be coincidence, but since 1.03 and eventually 1.04, I have experienced considerable increase in the DVAP not receiving, and when I go key up, the person I was talking to is already talking back to me. Now when I say considerable, by that I mean it never happened with 1.02 and now it happens almost every other transmission into the DVAP.

Based on the info I have, I'd like to get 1.02 back to rule it out before I go ripping apart my station. Thanks for reading my two cents!-Jarrod

I seriously doubt that the DVAP is overheating and shutting down. However, it doesn't work for the very same reason you don't run 100 watts when having a 2 meetr QSO with a vehicle right next to you. It simply overloads the front end of the receiver.

HI Jarrod. There are known issues with 1.02 and 1.03. There were no fixes in 1.02 over 1.01. If you wish to go back to compare, use 1.01.

Ok, Same thing was happening this morning. So we did a full factory reset of the 92ad and re-programed it, Also put FW 1.04 back on the DVAP and re-installed the DVAPtool app.

Now the good news is.
I had 4 QSO's after doing that and no one reported any dropout.s I even had a 1 minute 30 second transmission without a dropout.
Sp it looksl ike somhow the IC92AD was misbehaving or if it was a web problem and it fixed itself. So far so good.

Thanks 73 Ron

I updated my recently acquired DVAP from 1.02 to 1,04 and seen this very same problem. I was plagued with drop outs.

After spotting this post I switched to 1.01. Perhaps to satisfy my curiosity more than anything else.

Since switching, my drop out problem appears to have gone away?

Try V101 available on the DVAP site in the download section. I had no issues with that version.

I am still persistent with 104 as I am trying to find the reason it is dropping all the time. I find with short tranmission I have no problem. Its when I talk for say 30 seconds or more I usually find that I am talking to myself. There is no indication of me dropping out on the DVAP tool software either.

I did have an issue with 103 with more R2 than normal and also had the drop outs to. V104 has solved the R2 but not the dropouts.

So for now I will keep experimenting with 104 and if I need to do lots of transmission it is very easy to go back to 101.

Hi Dale. If you would, load firmware 1.04, start dvaptool, open the dvap, click on record, connect to a reflector, talk for long enough to see the problem, disconnect from the reflector, and click on stop recording.

Then send your recording file (dvaptool.dvrec) via email and I'll take a look.

Thanks and 73s,

I will make a recording as suggested to of 1.04 FW dropout and email the file. Tuesday afternoon.

But we had gone though all the suggestions.

1 - Reduce power on IC92ad to 100MW s-low setting Did not work but seemed to reduce the drop outs for a few QSO's

2 - Use the DVAP util and make sure I'm on the frequency. Correct frequency was checked. Did not fix the drop out

3 - Removed the USB extention cable and just use the provided cable.
Did not fix the problem.

4 - Set ICOM92AD back to factory defaults. Did not fix the problem

5 - Did a clean install of the dvaptool app. Did not fix the problem

6 - Made sure nothing else was running on my PC other than DVAP and Internet. Did not fix the problem. bY-THE-WAY THE pc IS A dELL xps 3.0 ghz QUAD CORE. When I watch the CPU usage with 1.01 I see very little usage maybe 0 to 1 or 2 percent durring receiving and transmitting. The soudcard is a creative xgamers version.

7 - Rest my internet conection. Did not fix the problem.

8 - Went back to FW v101 and ran now for many hours and long 2 Minute transmissions without a TX drop out. I also put the USB extenin cable back on. So I don't think it was an RFI problem.

last night I had done the same thing. But decided to go back to 1.04
and try the various suggestions. For a while their until started to make long transmissions. I thought things were working but no joy!.

Anyway. After I play with 101 for a while longer and make sure I'm not seeing the problem..
I will go back to 104 maybe Monday night and make recordings.

Thanks for your help and great product.

I fixed my problem, by wraping the plastic case of the DVAP in aluminum foil (just like a xmas present), leaving the sma port and the usb port as small openings, then attached small antenna and also placed a one turn loop in a ferite core on the small end of the usb cable. I use 100mw on my 92ad, no problems since, give it a try, its a cheap fix and it may solve your problem.

Are you guys executing DVAPtool from the command line and watching the output? I've seen this

```
transmit(on)
transmit(off)
transmit(on)
transmit(off)
```

And I also hear the beep on my 91AD as the dvap starts and stops transmitting. Normally the cause of this could be a poor Internet connection and I have to admit I've seen this more with my Verizon MyFi then my DSL at home. In most cases the audio from the other party sounds perfectly fine and there is no R2D2. The constant stopping of transmission by the DVAP is just a bit annoying because of the beep during a conversation.

Run the tool on the command line and do a paste of the output during the time when you experience this problem.

If you are under linux try this:

```
./DVAPTool | tee /tmp/dvap-log.txt
```

Chris

Thanks Jim,

I went back to 1.04 last night durring the net. I did not seem to have the problem. But then again. I had a couple of 30 second transmissions.
I went on the London reflector this morning and had a nice qso. made a long 1.5 minute transmission a couple of times. i could not reproduce the so called "black hole" problem.

I am beginning to think it may be temperature or interenet related.
becuase like I post before. But why don't i see it on v101?

These things always happen when you don't want it. When you want to reproduce it. Then it never happens.

But the foil covering is a good idea.

Could we expect to have DVAP available in Fried next week end ?

425. Only Six Channels on the ICOM IC-V82 Radio for DVAP

Yahoo group: DVAPDongle
Date: 2010-06-22 02:53:05 UTC
From: ann_charles2001
Topic: 425 Message: 425

I have the Icom IC-V82 radio that I am using with my DVAP. It works fine, but as I try more refectors and repeaters I have a problem. The radio only has 6 Channels for Your Callsign. The instructions for the DVAP told us to Your Callsign to link to refectors and repeaters. On channel is taking by CQCQCQ. So, that only leaves 5 channesl for refectors and repeaters. Am I missing something? Is there a work around? Can I use CQCQCQ and link to a repeater? The radio has 207 memory channels, but there are only 6 Your Callsign channels.

Charles, KC4Q

426. Login Issue

Yahoo group: DVAPDongle
Date: 2010-06-22 04:38:54 UTC
From: ve6mad
Topic: 426 Message: 426

Ive been having an interesting issue with 1.04.

When I try to link to reflectors, I am fine with the link command, but when I link to my registered repeater, it says :

" state change 7 Disconnecting.. state change 7 Gateway login failed".

Ive been having an issue with my call and I removed the A from the end and still no dice.

429. Re alleged 1.04 firmware problems

Yahoo group: DVAPDongle
Date: 2010-06-22 13:56:50 UTC
From: kg8nn
Topic: 382 Message: 429

There have been many assumptions that the firmware version 1.04 has problems. We have to be careful when making such claims and coming up with "fixes". This is a very intermittent problem on some DVAPs while other DVAPs have not had any problems. Trouble shooting these problems will be difficult due to the other possible causes. I will be listening to Robin as to how to proceed. All of the other ideas may lead us on a wild goose chase.

I have noticed that during nets often times I can hear a station responding to the net control yet the net control can't hear the response. I have also heard silence then the net control responding to an obvious comment that I did not hear. It seems important that what each one of us may or may not hear does not mean everyone else on the network hears or does not hear the same thing. Internet packet loss is not consistent across the network.
We have to be patient and understand how the system works.

Many users have the "Busy Lockout" feature enabled on their radios. This causes the radio not to transmit if a received signal is present. This might reduce R2S2. Digital Voice requires keying the mic waiting a split second before talking and keeping the mic keyed another split second at the end of transmission after talking. This seems to further reduce R2D2 as observed in testing on simplex on the repeater and on the gateway. A few local hams did some extensive "quick key" testing.

This newer technology requires us to expand our knowledge on how to operate the equipment. Maybe questions should be added to the licensing tests.

ANY observations you guys have had would be appreciated if shared. We learn more that way.

Thanks Steve for the other suggestions and IDEAS. I double checked my 92ad to see if busy lockout is on. It was always off. We also double checked the Time-out Timmer feature. feature and that is also off. We are still seeing the problem.

The strange thing is. It may take several long transmission for it to get into this state.

I honestly think it may be something do with the DVAP not having AGC and 100 MW s-low out running for more than a couple of minutes into the dvap may be causing the issue.

But thanks for the suggestions.

From: todd hartzel
Topic: 382 Message: 431

Greetings Steve,
Amen to that Steve. I hear this all of the time on REF001C. Hams assuming the problem always is the result of the other guy. When the problem could/would be the result of a problem with the station that is complaining about it. Your paragraph #2 is so true. I agree 100%. And I hear this result alot on REF001C.

They should not assume the problem is the other guy first. I do not talk much on REF001C, but I monitor alot. And this scenario plays out all of the time, thruout all of the week. If I am not connected in thru the DvDongle or DVAP, I am listening with the RadioReference.com scanner feed from the FL-Broward.

Again, you could not be more correct with parapraph #2. Thank you, for mentioning this. I was wondering if I was the only one hearing this too. 73 from n0vkg / todd.

From: ronchap@att.net
Topic: 439 Message: 439

I was just wondering if anyone has looked into or attempted to install the DVAP Tool Linux version on a USB Flash key with one of the Live versions of Linux.
If you have. I was wondering if you could pass along any tips or tricks and or instructions.
Such as which Live Linux version you used.
I'm currently looking at the Mandriva and Free Knoppix 6.2 disto's.
I have a couple of 1.8 and 2.0 GHZ broken lap tops. The only things that are broken are the CD Drive and Hardrives.
I was thinking. Instead of spending money on the HD and CD drives. Just buy a couple of 4 or 8GB flash drives and put a Live Linux version on the Flash. Plug that into one USB port and the DVAP dongle into a second usb port.
Boot off the LIVE LINUX USB FlasH drive and run everything from there.

It is not a hard task. I've built live USB sticks numerous times.

You'll want to look at something like Ubuntu and you'll want to create a live USB stick with a casper-rw partition. Once you boot it for the first time copy the dvdongle program to your home directory and it should end up in the casper-rw partition and usable during the next boot.

In this system you have partitioned your USB stick into 2 parts. One RO with a copy of the CD and the other RW (casper-rw). Any changes you make to the system (including updates) will be stored on the casper-rw

Any settings you configure for things like Evolution, Firefox, etc will be on the casper-rw. USB will be slower than disk but faster than CD and will work better since you'll end up with a place to store stuff, unlike a CD.

I hate to reply to my own post.
i'M PRETTY SURE YOU CAN NOT PUT THE dvap TOOL on to a live CD or DVD version. Becuase it looks to me that it needs to create a couple of files on the storage device. So since it's working on my external USB HD it should work on a thumb drive too.
Your current version of Linux is not your father's LINUX ;-),
Wow! was this easy and fast too. I think this install went much faster than even my Windows Vista or Windows 7 installs.
After I posted the 1st message I decided to jump in and Install
ubuntu 10.04 LTS.
I installed it on an External USB hard drive.
It found and installed every device I had including the drivers for the DVAP dongle which i had plugged in at the time of installation of Linux.

I've already made 2 contacts using the DVAP Linux Tool.

very neet.

445. Unable to link to reflectors from home network

Yahoo group: DVAPDongle
Date: 2010-06-25 17:26:11 UTC
From: jeffwh
Topic: 445 Message: 445

Hello all,

I have no problems with the DVAP at work or using my 3G network with my laptop or any other network I have tried. At home I have a Verizon DSL line (3mb) configured (currently) to be completely open. The DSL modem does NAT using 192.168.0.x internal IP addresses.

The problem I am having is that on my home network I can only link to reflectors/repeaters about 1 out of 50 connect attempts. On rare occasions it will link normally and everything works perfectly until I unlink and try to link again.

The audio comes through from the reflector and I can listen to my heart's content. I cannot transmit however as the DVAP does not think I am connected. The "Connected to:" bit on the UI is blank and the "Force disconnect" button does nothing. If I attempt to unlink from the radio, it plays the "Not linked" message to me as you might expect. So, from all appearances, I am linked only the DVAP does not know it.

Perhaps a timing issue on a response coming back via the network? I only have this issue on my home network, which unfortunately is one of the main places I hoped to use the dongle.

Here is the output when I power up the device and connect to REF001 C:

```
DVAPTool version 1.02
Restored parameters:
UserCallsign=KO7M A
DVDevice=COM3
Frequency=146550000
SquelchLevel=-80
TxPowerLevel=10
O/S: Windows 7
FTDI serial device on VCP port COM3
FTDI serial device COM3 valid
Callsign set to KO7M A
Frequency set to 146550000
Found 1 FTDI device(s)
new frequency (146550000)
Callsign set to (KO7M A)
Opening DVAP device COM3
Opened device COM3
Device name (DVAP Dongle)
Device serial number (AP010369)
Device boot firmware version (1.02)
Device app firmware version (1.05)
Device transmit frequency range (144000000 - 148000000)
Device receive frequency (146550000)
Device transmit frequency (146550000)
Finished reading from name server
```

```
Device modulation mode (GMSK)
DStar name server text message received ->You are running the latest version of DVAPTool.
Please check the DVAPDongle yahoo group for future software updates

Ascp device started
Squelch open, device rss (-78)
rss (-68)
New local RF stream:
hdr f 00:00:00 r2 DIRECT r1 DIRECT ur REF001CL my KO7M /JEFF fc 88ed OK
Checking callsign (KO7M ) against station call (KO7M A)
Starting Link request (REF001CL)
rss (-61)
rss (-56)
Local RF stream end
Connect requested
Connecting to gateway REF001
state change 2 Connecting to REF001
Squelch closed, device rss (-64) min (-78) max (-56)
state change 4 Authenticating...
```

At this point I start hearing voice traffic from the reflector. This occurs on all reflectors and repeaters, not just 1C. If I attempt to transmit in this state, it fails to transmit my signal to the reflector and I get the following output further confirming the thought that the DVAP does not think it is connected.

```
Squelch open, device rss (-67)
New local RF stream:
hdr f 00:00:00 r2 DIRECT r1 DIRECT ur CQCQCQ my KO7M /JEFF fc 6f17 OK
Checking callsign (KO7M ) against station call (KO7M A)
Ignoring transmit while not connected (CQCQCQ )
rss (-61)
Local RF stream end
Squelch closed, device rss (-56) min (-67) max (-61)
Sent transmission response to radio
Transmit state (ON)
Transmit state (OFF)
```

I am running Windows 7 and have attempted this running as a normal user and as administrator with no change in symptoms.

Thoughts on this?

Kind regards,

Jeff Whitlatch KO7M

Hello Nigel; nice to make you acquaintance on the radio this morning :-)

I've been experimenting with my DVAP since I received it yesterday afternoon, and have made a few contacts with my IC-92AD, both yesterday evening, and this morning. Quite a pleasant surprise so see how easy it has been to set up and complete my first digital contacts. I will still have a few questions to this group, but I'll just keep on working through my initial steps with this new technology, and enjoy how well it's going so far. The questions will come later, as I fine-tune what is required.

In order to stay on subject :-) I have install the latest firmware, and things are going well. Here at home, I've tried the DVAP on a desktop computer with Windows XP, an Apple laptop with Mac OSX, and a netbook with Windows 7 Ultimate. It works equally well (and installation was equally as simple) on all hardware. I've done the echo test (DVAP...I) from a few locations around the house and on our property, and as far as about 300 or 400 meters away. Wonderful work, my hat goes off to the developer of this hardware, and to the coder who has written the software - thanks.

Hi Jeff. We've seen a handful of folks that had router issues. You might first try power cycling your internet router and if that does not work, you might try replacing it with another brand. I've personally seen two Netgear routers that just quit forwarding UDP port 20001 which is used by DVAPTool.

One additional note.

The very 1st time you try to open the conection with the DVAP dongle.
You may get an error saying unable to establish a connection with the DVAP dongle.
Try a second time and then from there on it waill always find the DVAP when you click on open.

Thanks Chris

Just a couple of added notes.

It looks like with version 10.04 LTS of ubuntu. You may get asked to install a "software modem driver". Do not install this. It will prevent DVAP from running.

Other wise follow the posted instructions exactly and you should not have any problem. ;-)

Drivers for the FTDI USB chip used by the DV Access Point Dongle are included in most Linux distributions. Plug in the DV Access Point Dongle and download the DVAPTool archive at http://www.dvapdongle.com/downloads/DVAPTool-linux.tgz and extract to your Desktop. You can then proceed to the Using the DV Access Point Dongle page listed at the top of this page. Note that some distributions like Ubuntu include an accessibility package called brltty that must be uninstalled before DV Dongle use. Newer versions of Ubuntu may require disabling the Modem Manager

452. dvaptool for Linux - scrolling log

Yahoo group: DVAPDongle
Date: 2010-06-27 08:13:15 UTC
From: xscope2000
Topic: 452 Message: 452

Hi,

picked up my DVAP yesterday and haven't been able to put it down since - fantastic piece of kit.

I have a quick question, I've tried running the dvaptool on both Windows Vista and Ubuntu Linux.

On the Windows version I get 2 windows that open, one is the main dvaptool window showing the current status of the device, the other a scrolling log of activity, which is quite handy for looking up people's callsigns, and seeing which repeater they are connecting through.

On the Linux version I don't have this "scrolling log" window. Is there something I can do to enable it, or is this not available yet on the linux version?

Many thanks,

Chris - 2E0CTH

Hi Chris. On Linux and MacOS, you can see those messages if you start the program from a terminal window.

Thanks Robin for the reply. The "router" is a Westel 3500 DSL modem which has a built in WiFi/Wired ethernet router which was provided by Verizon when I signed up for DSL service. I will have to go back to Verizon I guess and see if we can try swapping it out or replacing it with a modem that has no router / NAT functionality, eh?

I did try the power cycle thing and it had no effect.

Can you point me to a complete list of TCP/UDP ports that you require?

Thanks,

Jeff - ko7m

How do you start the program from a terminal window for Mac OS x 10.6?
Sorry, its probably simple, just never used the terminal window.

Thanks

457. Re: Unable to link to reflectors from home network

Yahoo group: DVAPDongle
Date: 2010-06-28 02:06:20 UTC
From: jeffwh
Topic: 445 Message: 457

Update: I put the Westell 7500 DSL modem/router in Bridge mode and plugged my PC directly into it and temporarily set up the ethernet on the PC to the WAN static IP address and that eliminated the problem. So, it appears that something the DVAP needs to detect the link has been established is not passed by the Westell 7500.

This is not a long term solution, so I tried my Linksys WRV54G router behind the Westel and unfortunately, DVAP was now no longer able to obtain a valid list of gateways.

So, it is clear that I have a problem with the Westell and need to either replace it or find a router that I can use behind it as a NAT for my private network that is compatible with DVAPTool.exe.

Sigh... :) Thanks for the help.

I don't have a single "Game mode" with the Westell 7500. There are 50-60 specific games that can be enabled by name. So, without knowing what ports DVAP requires, I am unable to make an intelligent choice as to which game would suffice.

Kind regards,

Jeff - ko7m

From: Jan Timmers
Topic: 452 Message: 460

That depends on where you've installed the application. I've installed mine just for my use, so it's here:

/Users/johnt/Applications/DVAPTool.app/Contents/MacOS/DVAPTool

(my user name in johnt - your's could be different :-)

And the terminal program (if you've never used it and don't know where it is) is /Applications/Utilities/Terminal.app - just start that once, and then select "Keep in dock" on it's icon in the dock to start it easier the next time you use it.

I've tried in on my Macbook Pro, with the same OS version as you have. It works just the same as described by Robin.

From: aa4rc
Topic: 445 Message: 461

Hi Jeff. Unlike echolink, there are no ports that you have to forward on your router. I've never had to adjust a router to make it work (which makes using it at hotels and public wifi spots easy).

For reference, however, DVAPTool currently uses TCP/UDP port 20001.

462. Re: The DVAP is a beauty!!

Yahoo group: DVAPDongle
Date: 2010-06-28 23:34:12 UTC
From: ronchap@att.net
Topic: 329 Message: 462

I just passed the 72 hour mark 32 QSO's on various reflectors and repeaters running DVAPTool on my Linux box without a hitch. I have not turned off or had to reboot, reset or re-load anything during this time. Along with the latest FW 1.05 in the DVAP dongle, I think
currently this looks like set and forget hardware setup.
Since this now looks solid. I'm going to try and extend the range. At least to down town Elysburg 1 1/2 miles using both a X50 Dual band Vertical, and a SRH77CA 15 inch dual band HT antenna along with a tiger tail to the IC92AD HT. I also have an old Egg beater antenna in storage. I may try that too since it puts lobes out at the horizon.
I'll let you know.

As has been said before. This is a great mode and great product. IMOP. I think it's worth the extra money. I'm very glad I went with DSTAR rather than spending my limited money on something else.

Hello Robin!
So, I tested the dongle at my desktop computers (two) in my office
and I had no problem with the USB-Driver - no connection problem!
On my DELL-notebook I tested now all USB-ports include dogging
station. After boot my computer I connect the dongle (No dongle is
found - message) and disconnect it. New connection and then it works!
I saw at the FTDI device driver side a new driver!
My dongle installed automatically driver version 2.06.00!
Is the FTDI device driver 2.06.02 from 31st march 2010 tested?
Perhaps it will repair my problems!

464. New to DVAP

Yahoo group: DVAPDongle
Date: 2010-07-02 01:56:54 UTC
From: Cory
Topic: 464 Message: 464

Hello to all,

I just got my DVAP, and am having trouble setting it up. For some reason, the directions posted on the dvapdongle.com site isn' quite what I'm seeing when I installed it. Can anyone give me any direction as to how to set this up? I wish I could list some more specific issues, but I'm not very PC savvy and don't know very much about this device.

I would appreciate any/all help. Thank you!

Topic: 464 Message: 465

I got my DVAP about a week ago, and set it up on 3 computers, one with Windows 7, another with Windows XP, and also on a MacBook Pro. And I followed the steps on the dvapdongle site. Worked for me right out of the box.
The settings on my IC-92AD were a little confusing to me, but I wasn't too familiar with either the DV process, or the radio itself. That took a couple hours with the manual on my lap, and some information on the dvapdongle site.

What is your problem specifically? Can't install the software, or can't program the radio?

Regards:

Jan Timmers - VE7JBT

It should be pretty straight forward, enter your gateway registered callsign, pick a simplex frequency, Click "OPEN".

Setup your radio to transmit on the frequency you picked. You need entries to link to whatever gateways you want, one with a "U in the 8th character to unlink and one with "cqcqcq".

All this is on the DVAPDONGLE website

Hi Murray (and the group)

Thank you for the updater, but I must still not be doing something right, as I cannot bring up the DVAP program. Here's what happens...

I plug in the DVAP
The green light blinks as it should
That's all

The TWO times I have been able to get it going (and I cannot recall what I did to get it going), I was able to connect to various repeaters, and people can HEAR me, but for some reason, I canNOT hear them. All other functions appear to work (echo test, ID, etc.), but that's it. Any suggestions? I have read from the DVAP website that there is/may be a driver that I may need to download, but I don't know which.

I'm not that computer savvy, so if there was something that I should be doing, let me know. When I downloaded the updater, my DVAP lights blinked (should they have?), don't know if this is a good sign or not. However, a window said that the download was "100% complete". Thanks!

Hi to the group...

OK, my problem has been solved. I'm embarrased to say it, but I forgot the last step in the installation process, and that was to SAVE the actual application to my desktop. OK, now onto one more small issue. I get an audio prompt along the lines of "gateway unknown", and need to unplug the DVAP and replug it in, then it seems to work. However, once I link to a gateway, one of the following two things happens...

I can be heard coming across the repeater, but I can't HEAR anyone call me back
I canNOT be heard coming across the repeater, and still can't hear anyone call me

Any ideas? By the way, I really appreciate the replies I've gotten. Thank you very much!

Hi Cory-

I ended up with 2 programs -

DVAP FM and "DVAP Tool", you need to run the DVAP Tool,

I think that I had to go into my program directory and find it, and then
send a shortcut to the desktop.

I don't know what the DVAP FM does, but it doesnot run the program for the
DV Dongle.

That's about as far as I can help you, I'm still fighting with the
connection process, as well.

Good Luck,

Murray

Hello,

Well, everything is loaded, and I can log onto various reflectors, but I can't seem to hear myself come through the local DSTAR repeater, nor can I hear anyone call me through the same repeater. I have no problem with anything else...using the echo test, ID, etc. The downfal is that I'm NOT computer savvy, so any tips/advice will need to be very basic.

I hope I get this fixed...it seems as if I'm just one step away...yet so far.

From: Cory Spankowski
Topic: 464 Message: 473

Hi Murray,

Well, I got that problem resolved. Now that it's up and running, I can link with any gateway, and everything appears to be working. However, I can not hear anyone. In other words, when my brother calls me (who is in the other room) via the repeater I'm linked up to, nothing comes through my DVAP. Am I missing something?

Hi Cory-

I ended up with 2 programs -

DVAP FM and "DVAP Tool", you need to run the DVAP Tool,

I think that I had to go into my program directory and find it, and then send a shortcut to the desktop.

I don't know what the DVAP FM does, but it doesnot run the program for the DV Dongle.

That's about as far as I can help you, I'm still fighting with the connection process, as well.

Good Luck,

Murray

Hi Murray (and the group)

Thank you for the updater, but I must still not be doing something right, as I cannot bring up the DVAP program. Here's what happens...

I plug in the DVAP
The green light blinks as it should
That's all

The TWO times I have been able to get it going (and I cannot recall what I did to get it going), I was able to connect to various repeaters, and people can HEAR me, but for some reason, I canNOT hear them. All other functions appear to work (echo test, ID, etc.), but that's it. Any suggestions? I have read from the DVAP website that there is/may be a driver

that I may need to download, but I don't know which.

I'm not that computer savvy, so if there was something that I should be doing, let me know. When I downloaded the updater, my DVAP lights blinked (should they have?), don't know if this is a good sign or not. However, a window said that the download was "100% complete". Thanks!

474. DVAP Refector Loses Connection After a While

Yahoo group: DVAPDongle
Date: 2010-07-04 11:08:37 UTC
From: markg
Topic: 474 Message: 474

I have a DVAP with version 1.05 Firmware. I sometimes turn on my IC-92ad and just leave it on connected to reflector 1C. I might go away for a couple of hours and come back and look at DVAP tool 1.02 and notice that I am no longer connected to the reflector. Does anyone know why this happens? Could it possibly be something with the internet connection which is FIOS or a bug in the DVAP software? Any insignts would be appreciated. Mark KB3Z

475. DVAP-need help

Yahoo group: DVAPDongle
Date: 2010-07-04 13:16:27 UTC
From: duganman9
Topic: 475 Message: 475

First, thank you for all the help.

I have a 92AD and a DVAP. I use a Mac Book Pro running "boot camp" with Window 7. All works well, however, I am still learning. I run RT system software with Win 7.

One of my issues is connecting the DVAP to a reflector. Yesterday, I was able to connect to DVAP E and hear my message. I could not run DVAP I. I am not sure how I connected and did not hear the "connected" message. One test was on a simples freq.(145.600, and I could not duplicate the same test on 147.320.

I have a time using (remembering) the sequence of key selection to get me to the right places. Is their a written sequence for "key management" as I call it.

Finally, Your thoughts on using the DVAP on the Apple or Window 7 side of a computer. I must say the Apple view looks sharper.

Your answers may generate more question on this end. I appreciate your indulgence.

Charlie,

WB2CIC

Hi Robin (and the group),

It appears as if the 2 repeaters that I thought I was having trouble getting into were, in fact, just inactive. I looked alot more closely on the D-STAR website and tracked my activity, and I was being registered on each gateway/reflector I connected to. So, I tried connecting to a gateway in San Francisco, and VIOLA! I not only heard, but I WAS HEARD! So, since, I've been connecting to reflectors/gateways and having a great time with it!

Thanks to all for tolerating my posts/questions, and a special thank you to those who responded with advice.

Take care and 73-

Hey,

also if im not Mistaken some repeaters will not allow DVAP/DVDONGLE's to connect and was frowned upon because of bandwidth issues.

Someone correct me if i am wrong

From: Ken
Topic: 474 Message: 478

Hi Mark;

This happens occasionally, when the DVAP misses a series of pings from the remote gateway or reflector, due to latency or bandwidth issues on either end, it disconnects itself. Check the DVAP log to be sure... but it's the most likely reason and probably happens to everybody.

Funny,I have heard just the opposite. I have heard that the DVAP takes less bandwidth than the original dongle.

I have heard people have had great success with tethered cell phones. If true, that would tend to bear out the less bandwidth theory.

The DV Dongle and DV Access Point Dongle use the same protocol for internet conversations and, as a result, use the same bandwidth.

markg,

Is your computer directly hard wired to the router or is it using a WIFI connection?

If you are using WIFI. If possible. Try to connect directly to one of the routers ports and see what happens.

Amateur Radio Station KA2HZO'S
Consistent 1 Mile Plus (1.25 Miles) DVAP Connection Setup
No Amplifier is used.

Notes: 7/7/2010

I - Materials List:

1 ☐ DVAP with USB cable included.
The DV Access Point Dongle connects to your PC or Intel based Mac via a USB port and provides a 2 meter Access Point for use with a D-STAR radio. Using an Internet connection, a user may connect to and communicate with D-STAR gateways and reflectors around the world. The DVAPTool application used with the DV Access Point Dongle may be installed and run on Microsoft Windows XP/Vista/7, Mac OS X Leopard/Snow Leopard, or many flavors of Linux.
http://dvapdongle.com/DV_Access_Point_Dongle/Home.html
The DVAP firmware version installed is 1.05. Corrected the drop out issue.

2 ☐ Computer 2GHZ AMD 64 Bit with 4GB of RAM Notebook PC Ruuning the Ubuntu LTS Linux with the DVAPTool 1.02 from the 8gb plugin FLASH drive. Set up a 1GB Persistent partition.
You can use the instructions here with the Universal Installer to put linux on a bootable USB stick with DVAP.
http://www.ubuntu.com/desktop/get-ubuntu/download
Or just install the DVAPTool on a MS Windows, Mac OS or Linux OS.
Don't forget to read the instructions at the DVAP web site.
http://www.dvapdongle.com/DV_Access_Point_Dongle/Home.html

The Computer is plugged into the Linksys 610N dual band Router's GB ports. Note. We found that we have less reflector disconnect issues with the computer network card plugged directly into the router.

3 ☐ Verizon Internet service 3 Down 1 Up service plan.
Speed test shows 2.68mbs down and 412kbs up and ping of .36.

4 ☐ IC-92AD
 VHF/UHF Dual Band Transceiver
http://www.icomamerica.com/en/products/amateur/handheld/92ad/default.aspx

Frequency set to 146.550 mHz Power settings High = 5W Mid = 2.5W
Low = .5W S-Low=.1W

5 ☐ Diamond SRH77CA Dualband HT/Scanner Antenna
High quality, high gain + receive 120 MHZ, 150 MHZ, 300 MHZ, 450 MHZ, 800 MHZ AND 900 MHz HT antenna.
Increase the performance on your handheld or wideband scanner with a Diamond® SRH Series antenna.

6 ☐ Dual band tiger tail (Counterpoise) wires 6.5 and 9.5 inches long attached to the belt clip screws of the ICOM92AD.
Here is an interesting Youtube video on making a tiger tail counter pose.
http://www.youtube.com/watch?v=ULynXY1Gq5g

7 - X50NA Dualband Base/Repeater Antenna
http://www.rfparts.com/diamond/x50na.html

The antenna is placed in my attic. I used an old tripod with a pole attached to attach the x50 to it with a couple of hose clamps. There is no insulation along the walls in the attic. But there are Asphalt Shingles and flashing on the roof.
The hight of the antenna is abut 15 feet at the base (ground plain elements)

8 ☐ 20 feet of LMR 240 Series SMA Male to N-Male Cable.
I highly suggest that if you plan on going longer than 20ft. You use the LMR 400 Series low loss cable instead of the 240.

That's pretty much all the materials.

II - Here are some calculated results:

1 -Line Loss Calculation

Line Type = LMR 240 Series
Line Length: = 20 Feet
Frequency: = 146.550 MHz
Load SWR: = 1:1
Power In From DVAP out = 0.010 W

Resulting Power out to base of X50 vertical antenna = 0.009W

2 - Pure ERP And EIRP Calculation

Actual Transmitter Power Output = 0.009W
X50 antenna gain at 146.550MHz = 4.5DB
Results:
Effective Radiated Power (ERP) = 0.01547 or about 15 MW
Effective Isotropic Radiated Power (EIRP) = 0.02537 or about 25 MW

III - Conclusion

My main goal in this test setup was to allow me to walk down town to both the park and stores while still maintaining access to the DSTAR world wide network from the DVAP located at my QTH with my HT.
I managed to meet this goal. I've determined though both the DVAP echo tests and live chats. That I can exceed the 1 mile range without much if any packet loss running both 2.5 and 5 watts at this range. (This is with obsticals such as brick buildings and fully covered trees blocking line of site to the DVAP antenna (X50).

I wish to thank the reflector 001C group for letting me run these range tests. Along with N3FO, KC2RXV, WX4JCW, N8QQ, KC8YQL and the many others I have spoken to in the past 3 weeks for their suggestions and help in getting this Going.
I also send Kudos to Robin AA4RC and Moe Wheatley
for getting the updated version 1.05 firmware out as fast as they did.

I hope you all find these notes of some use.
I may have left something out. So if you have any questions or suggestions please feel free to drop me a note.

DStar is a great mode. It's also great for HAMS living in retirement and assisted living homes. Where they can no longer have access to HF radios and antennas.

DSTAR is great! Love it. It brought some Ham radio fun back into my life

Best 73

From: Keith Marang
Topic: 490 Message: 490

Hello all. I have just installed my DVAP, but keep getting the "No Gateways Found" error. I verified the internet connection. At first I had a wireless connection to my D-Link DIR-655 router. Then I removed the wireless connection, the router and used a direct connection to my cable modem. I still get the "No Gateways Found" error on startup. I tried disabling my Norton firewall and then the virus protection. I still get the error.

I have also updated the firmware to v1.05.

I have been a DStar user for a couple years, so being registered is not an issue.

Any help would be appreciated.

Hi Doug,
After we talked last night. I gave both those machines a try

I ended up having the same issue here with those 2 machines you listed.

Yet, I'm able to link to and have QSO's on many other repeaters. Including W8DIG which is in the same area.
Try W8DIG and see if that repeater works for you.

Hello Doug,

Try removing the "A" from your call sign in DVAPTool.

I can now access gateways like AK4EG and here myself on the Live TV stream.

Let me know how you get on.

73.

Danny

The callsign on the DVAP (including the "A" initial, if any) needs to be registered with a gateway somewhere in the network... because that's what will connect to the gateway.... regardless of what's set in the radio. For example:

login request from 24.XXX.128.42:1183 KC4YOZ A:AP010152 RW passed 2010/07/10 08:52:22.148

73;

All,

I am registered thru W8HEQ gateway.
I can make direct contacts thru W8HEQ when NOT using the DVAP
Did remove the space A on the DVAP tool.

With those suggestions implimented, I did try connecting to W8HEQ and K8BIG again and received the "receive only" message. I tried making a QSL with other stations but no luck.

Keep the suggestions coming.

Doug,

If you get the receive only message, that would indicate the call in the Station Callsign field of DVAPTool 1.02 is not registered. This would hold true for any gateway connection attempt. "KD8LAM" and "KD8LAM A" are registered callsigns that you can put in that field. Recheck your spelling and try again.

Regards,

James, N0XIA

Something strange is going on. I don't think you or I are doing anything wrong.

I spent a couple of hours today connecting to many machines
Including AK4EG without having a problem or getting that receive only message.
The only thing stopping us from using those two machines is if it's not seeing our DVAPS as being registered on the network. But they are registered. Otherwise we would not be able to connect to all those other machines including AK4EG.
But the rest of the world does seem to at least have my dvap as being registered and letting me connect with no problems.
So far it's only W8HEQ or K8BIG that are not letting me transmit.
Maybe they didn't pick our call signs up for some reason. But then again why does AK4EG and others work fine?

Doug,

You are correct. It would appear that your callsign is not recognized as being registered at least on W8HEQ and K8BIG. There is nothing wrong with your DVAP. Your call is good according to http://query.ki4swy.org/. I am curious to know if you can do a dplus command like linking or unlinking on W8HEQ from one of the rf ports? This may require W8HEQ Admin help to see what gives. I take it the DVAP works connecting to other gateways and reflectors besides these two?

From: Charles De Poalo
Topic: 489 Message: 500

Good Day to all:

My call sign (WB2CIC) is registered at W4DOC and is working with my 92AD. I do not understand the DVAP registration. My take: does the DVAP need a separate registration? If so, I am not sure how to enter the information.

Also, at the end is added "....login request from 24 XXX.128.42.....148", I do not understand if this is entered or a readout some where.

Thanks for helping me sort out this stuff.

501. DVAP Tool question

Yahoo group: DVAPDongle
Date: 2010-07-12 07:34:22 UTC
From: Graham Pemberton
Topic: 501 Message: 501

Hi all,

I have just become a member of this group and am waiting for my DVAP to arrive from the US, I already have a DV Dongle which is working great and I have to say that I am very impressed with it and the DV Tool software, I am currently running DVTool2 beta4 on a Macbook Pro.

Is there a beta version of DVAP Tool that will run natively on a Mac that I can download?

James,

I just went though a list of machines I had programmed in the 92ad via the DVAP.
They all worked but the same 2 that Dough is having problems with.

List of machines I just checked without the problem.
These all work fine.

AA1HD
AK4EG
K0HAM
K0MDG
K1HRO
W8DIG
K1RFI
K1RHF
K1XC

But when I try and link to W8HEQ or K8BIG.
The "Receive Only" message is sent.

It looks like it has something with those 2 machines.

Go here:

http://www.dvapdongle.com/DV_Access_Point_Dongle/Downloads.html

...dl the DVAPTool Mac software. To update your DVAP to the latest firmware, though, you might have to resort to a Windows OS computer, I don't think it's possible with the Mac. The latest version (1.05) is a windows file format.

Others may correct me, but this is what has worked for me on a Mac.

505. Squelch options for next firmware update.

Yahoo group: DVAPDongle
Date: 2010-07-12 22:35:04 UTC
From: Trevor
Topic: 505 Message: 505

If I could request anything to improve on for the next firmware release it would be a coded squelch option. I know it was probably not part of the initial build probably to discourage operators from altering the access points from it's original operation intent of covering only a small area of usage. However, I experience a quite a bit of RF interference from not only the computer it is attached to, but other electronic items around the house.
The interference is detected on my 92AD and the DVAP it self. The HT picks up the RF and causes it to activate it's standby beep constantly and the DVAP will sometimes transmit that the access point is already connected or disconnects and I have not sent any commands to it. (No I am not being kicked off because of "Missed Keep Alive Packets" Both the HT and the DVAP squelch bar indicators jump around constantly.
Yes, I know I can adjust the squelch sensitivity on both apparatus, but I shouldn't have to adjust them over 2/3 to reduce the interference. This also reduces the effective range for communication. I know that I can also move the AP to reduce RF interference. I have exercised the options to reduce the interference, but with a simple option to activate CTCSS or DCS these problems would not be so much anymore.
Just a thought.

From: kf4var
Topic: 506 Message: 506

Hello to the group

I am new to D Star and although I own quite a bit of Icom equipment I do not currently own a D Star radio(awaiting the 9100).

Currently I am involved in volunteer disaster communications in Mobile Alabama. I operate both HF and VHF networks here on the Gulf Coast. We have a D Star repeater in this area. I consider the possibility that D Star might be a very valuable adjunct to traffic passing in the event of a disaster but want to evaluate the system before commitment to purchase a comparatively pricey radio that might prove of marginal usefulness.....

From what I understand, the capabilities of the DVAP Dongle are as follows-- that I can use the dongle much like the DV Dongle is used-i.e. to gain access to the D Star network via the internet. I also understand that I may use the DV Dongle along with a laptop, the appropriate headset and correct configuration, to access the D STar repeater here directly from the computer--via radio link and without an internet connection..... I am somewhat confused by this however because in the manufacturers page of FAQ here

http://www.dvapdongle.com/DV_Access_Point_Dongle/FAQ.html

it states that among the things one must have is a D Star capable radio to use the dongle. I was under the impression that the DVAP Dongle would access any D Star repeater with either digital voice or text,and either via the internet or directly via radio--- much the same capability that one would have if one bought a D Star capable HT or mobile unit from Icom. Otherwise why the transceiver portion of the dongle???

Any advice or clarification anyone could offer would be deeply appreciated

Warmest Regards and 73

Coded squelch (CTCSS/DCS) is an FM feature. It does not apply to DV mode.

Aren't you just masking the problem of the interference. Wouldn't it be better to resolve the interference issue? Does the interference exist all across the 2m band? Surely, there are frequenccies that could be used at that location that are clear. If not, you really have a severe interference problem that needs to be resolved or it would be affecting all of your radios.

OK Phil,

I connected this morning to W8HEQ without receiving the receive only message.
So what ever you did looksl ike it fixed your machine.
I wonder if you could be so kind and pass what ever you did over to K8BIG which is still having the issue as of 7 AM tUESDAY MORNING.

Thanks so much for getting this fixed.

Perhaps he was referring to "igital code squelch" as described on page 91 of the 2820 manual. Or "digital call sign squelch".

I stand corrected. What I should have said was "DSQL" Digital Code Squelch. The squelch option specifically for DV.

512. RE: [DVAPDongle] DVAP Dongle capabilities - AND EmComm

Yahoo group: DVAPDongle

From: Donald James
Topic: 506 Message: 512

Hello Car (and the group),

Donald here (N2VU). As far as I know, the DVAP (RED) dongle is only to be used with a radio, and the other BLUE dongle is to work through your computer but doesn't work with a radio.

I do believe we're in the same position in that I volunteer with Warren County, NY. RACES, and I'm looking at D-Star as an option to pass emergency traffic faster than the current way we're doing it, which is the basic reading of messages to each other. I believe that we're quite fortunate in that the head of Emergency Services in this county is very suportive of our group but I also know that he would appreciate it if we'd be able to pick-up-the-pace a little when doing traffic handling as he's seen or heard during state or multi-county drills.

I'm anticipating the arrival of my DVAP dongle along with the IC-92AD (and accessories) that I ordered this weekend by later this week. I've never been into digital modes until now and I think its because of the benefits that I've seen demonstrated about D-Star (and P25) on youtube videos that I'm eager to try this. You're lucky in that there's already a D-Star repeater in your area, there isnt one for at least 100 miles from where I am, so as far as I know (and I've been asking around a lot) I'll be the first in the area with a D-Star radio. I'm sure there are those who'd like to see me regret it because of the negativity that a lot are projecting but then I suspect that others are interested to see what I'll be able to get out of it, though it'll be a little tougher just being one. Kind of like trying to demonstrate the telephone but with only ONE!

I'd like to ask you and any others in this group that are involved with any Emergency Services to please share what they've been able to accomplish with D-Star. Is there a program that works with D-Star that I can download that will send text, so that (assuming I get the right cable to marry my 92AD to laptop) would allow me to send messages. Please don't flame me for asking what must be a rhetorical question for many, like I said, I'm brand new to digital - and I've been a ham for more than 20 years. In fact, I guess it would be more appropraiet to start a D-Star EmComm thread for those who'd care to contribute.

Car, I'd be happy to share with you whatever I discover about D-Star for EmComm and ask you if you'd be so kind as to do the same with me.

73's for now ~ N2VU

Subject: [DVAPDongle] DVAP Dongle capabilities

Hello to the group

I am new to D Star and although I own quite a bit of Icom equipment I do not currently own a D Star radio (awaiting the 9100).

Currently I am involved in volunteer disaster communications in Mobile Alabama. I operate both HF and VHF networks here on the Gulf Coast. We have a D Star repeater in this area. I consider the possibility that D Star might be a very valuable adjunct to traffic passing in the event of a disaster but want to evaluate the system before commitment to purchase a comparatively pricey radio that might prove of marginal usefulness.....

From what I understand, the capabilities of the DVAP Dongle are as follows--that I can use the dongle much like the DV Dongle is used-i.e. to gain access to the D Star network via the internet. I also understand that I may use the DV Dongle along with a laptop, the appropriate headset and correct configuration, to access the D STar repeater here directly from the computer--via radio link and without an internet connection..... I am somewhat confused by this however because in the manufacturers page of FAQ here

http://www.dvapdongle.com/DV_Access_Point_Dongle/FAQ.html

it states that among the things one must have is a D Star capable radio to use the dongle. I was under the impression that the DVAP Dongle would access any D Star repeater with either digital voice or text,and either via the internet or directly via radio--- much the same capability that one would have if one bought a D Star capable HT or mobile unit from Icom. Otherwise why the transceiver portion of the dongle???

Any advice or clarification anyone could offer would be deeply appreciated

Warmest Regards and 73

Carr,

Put quite simply, the DVAP provides an interface between a D-STAR HT and the Internet through a computer. This allows you to wander your home or your yard or some say your neighborhood and still access D-STAR repeaters all over the world. I live in an area where there is no D-STAR repeater I can hit with mt HT. The DVAP acts as a mini repeater and gives me that access.

The original Dongle allows access to the D-STAR network by computer.

The two have very distinct functions and you may require both depending on your needs. Both require some type of internet connection.

If you want to sit at your computer and talk over the D-STAR network or your local repeater, the original Dongle is the right choice for you.

If you have a D-STAR HT and want to extend it's range with the D-STAR network or access local D-STAR repeaters you could not reach otherwise with you HT, then go for the DVAP.

Hope this helps. 73 Louis KG4QPQ

PS - On the value of D-STAR in emergency communications, I think others have already done that evaluation and found D-STAR to be an excellent tool. Check out the various D-STAR site, especially Georgia.

The DVAP Dongle and the DV-Dongle are two different products. The DV-Dongle allows you to access the D-Star network from a computer using the computer's audio in/out. The DV-AP allows you to access the D-Star network from a VHF D-Star radio via the DV-AP that is connected to your computer.

I have one of each and am very happy with the products.

From: kf4var
Topic: 506 Message: 515

I wold like to thank all of you for the input on D Star and DVAP. Particularly for clarification between the normal dongle and the one with the radio set in it. I currently dont see the need to set up a local wireless D Star access point here i.e. the DVAP since I am only in evaluation phase with this adn do not have a D Star radio yet..... However I can see quite a number of possibilities using the DVAP in local disaster communications, depending on the type of disaster and how far down the local infrastructure might be. I also think it might be valuable to have a separate thread here by and for people who anticipate using both the dongles, the radios and the D Star system in disaster scenarios and more particularly those that have used the equipment in disaster scenarios--- and what they found to be both the strong and weak points of the system.

Donald N2VU-- I am also a RACES member here in Mobile Al. I host one of the 2 M practice nets here as well as participate in a number of daily HF nets as well, primarily on 75 M. Like you I see the value of having the D Star capability to aid in traffic handling. What we are in process of here is teaching the people to use the ARRL message form and system to pass the info. I can see how valuable it would be to have a D Star station on frequency to be able to take traffic or even better depending on geography and coverage, have the D Star node station QSY to a simplex frequency to take traffic thereby not tying the rest of the net up. Particularly when there is a lot of traffic.

Another thing I can see happening is non integration of D Star with regular disaster voice networks without a LOT of work by area ARES co ordinators-- the newness of the technology and the price point may put D Star out of reach for many people at least for now and until the price of the radios comes down. The D Star group particularly if there is a D SStar machine in the area, may go off by themselves and not participate in the local voice group. If this happens in my opinion, it could be a huge detriment to the effectiveness of the area net. D Star even through a node station i.e someone with D Star capability participating in the voice nets.....and for that matter other modes should be "nodes" n the voice nets as well i.e. those with HF capability, and even more specifically those that are CW and those that may do HF digital modes like PSK, RTTY and MT 63....should be incorporated into the existing nets and moreover the participants, both D Star and non D Star should have practice with this integration, with passing traffic both into and out of the D Star system as well as others.....and in my opinion should practice passing traffic in simulation where there is no D Star repeater functional nor any functional internet in the area....i.e.passing traffic simplex to an HF node that could get on one of the HF nets to get the stuff out of the area---- much like what might happen here on the coast with the advent of a Category 2+ hurricane hitting the area,no electricity or internet and and many or most of the local VHF/UHF repeaters down..... I have even thought of and am working on trying to incorporate some of the CW guys in this type of scheme here because hurricanes are huge static machines, many times making the HF bands almost unusable for anything other than CW.

Thoughts??
Again thanks to all
Carr

UPDATE: After contacting Robin, he found that my IP address was within a group of blocked IP's that were suspected to be used by hackers. He had to allow my IP to contact the name servers. Hopefully when my internet provider renews my IP address with a different one, it won't be blocked. :-)

Thanks for your help.

As of Wednesday afternoon 4:00 PM. I just want to let the powers in charge at K8BIG that it's still not letting me access the machine without coming back in receive only mode. As suggested in an another post. I erased and re-programmed the K8BIG entry with no success. I also reset my router and modem.

I don't think the issue is on my end since Robin was able to fix it on Phil's machine.

Any ideas why K8BIG is not working for me but all the others are?

Could K8BIG be seeing my IP as a bad IP or a Blocked Ip for some reason?

Thanks
Ron/KA2HZO

Topic: 489 Message: 519

As I stated earlier they are working on it, I gave them the information needed to effect the repair. The "C" port of K8BIG is connected to REF001C so access to it is (and should be) through the reflector, if you need access to the "B" port I'm sure we can come up with a work around. Email me off list and I can set up a link on a schedule for you.

Dstar more. Worry less.

520. Receive only

Yahoo group: DVAPDongle
Date: 2010-07-16 14:01:06 UTC
From: Noid Wilson-NM5I
Topic: 432 Message: 520

I know this was recently discussed, I looked over my details and don't see a problem. I recently changed my callsign and updated the data on the Gateway for the W4RNT D-Star group. How long does it take to have the system acknowledge an update and the changed callsign? I can hear conversations no problem and have the A designation on the dstar registration for the DVAP. I don't see anything different from my N9RLR callsign to my updated NM5I callsign.

Thanks in advance.

Hello Noid,

You can check any call at this site: http://query.ki4swy.org/ (not real time, but hourly or less).
Some people will tell you that it takes a few hours to see terminal changes synchronize with the network. My testing shows that it takes about five minutes, ever since the G2 software was upgraded back in May by the trust server team.

The 2 meter version is working great on my Linux Box.
I was wondering when you guys come out with a 70CM version if it could run along side the 2 meter version on the same PC. (Each plugged into a USB port on the computer at the same time.

In other words have 2 instances of the DVAPTool running. One for the 2 meter and one for the 70CM version at the same time.

Thanks
Ron

Yes, I agree Ron, I'd love to see a 70cm version too. I've been annoying Robin about it a couple of times. I've managed to simultaneously run a HotSpot, DVAP and DV-Dongle on the same PC. Running two DVAP's at the same time would be interesting. Whilst the DVAP & DV-D are happy to run via a USB hub, often the HotSpot Node Adapter is not. But this issue has been discussed elsewhere.

As a side note, a few of us here in VK3 have upgraded the DVAP firmware to v1.05 and the improvements are obvious.

From: Donald James
Topic: 506 Message: 526

I would like to thank all of you for the input on D Star and DVAP. Particularly for clarification between the normal dongle and the one with the radio set in it. I currently don't see the need to set up a local wireless D Star access point here i.e. the DVAP since I am only in evaluation phase with this adn do not have a D Star radio yet..... However I can see quite a number of possibilities using the DVAP in local disaster communications, depending on the type of disaster and how far down the local infrastructure might be. I also think it might be valuable to have a separate thread here by and for people who anticipate using both, the dongles, the radios and the D Star system in disaster scenarios and more particularly those that have used the equipment in disaster scenarios--- and what they found to be both the strong and weak points of the system.

>>> Carr, Today is a week, full 7 days that I'm a D-Star "subscriber" as I like to put it and I have to say that I am enamored with it. I have been using a DVAP during this time and as of tomorrow, if plans work out, I'll have the chance to try out a 25 watt hot-spot. If 10 mw can give me the better part of a 1000' radius, the 25 watts will seem like a kilowatt. As for your thoughts about disaster situations, as long as you have some form of internet access during this disaster, a DVAP can be great but just note the vulnerability in this.

Donald N2VU-- I am also a RACES member here in Mobile Al. I host one of the 2 M practice nets here as well as participate in a number of daily HF nets as well, primarily on 75 M. Like you I see the value of having the D Star capability to aid in traffic handling. What we are in process of here is teaching the people to use the ARRL message form and system to pass the info. I can see how valuable it would be to have a D Star station on frequency to be able to take traffic or even better depending on geography and coverage, have the D Star node station QSY to a simplex frequency to take traffic thereby not tying the rest of the net up. Particularly when there is a lot of traffic.

>>> There is no doubt to me that if a community commits to D-Star, and really learns all that there is that you can do with it, you've got all the benefits of the digital modes consolidated. If anyone thinks I'm wrong then please correct me.

Another thing I can see happening is non integration of D Star with regular disaster voice networks without a LOT of work by area ARES co ordinators-- the newness of the technology and the price point may put D Star out of reach for many people at least for now and until the price of the radios comes down. The D Star group particularly if there is a D SStar machine in the area, may go off by themselves and not participate in the local voice group. If this happens in my opinion, it could be a huge detriment to the effectiveness of the area net.

>>> This is a very likely scenario. D-Star is obviously more expensive and today, people everywhere shop for price. The word "quality" has been redefined or incorporated with the term "most-inexpensive". So this will certainly create a divide with many. I love 220MHz, and I used to see that as a sort of private band as many don't care to spent whatever to get a 220 antenna and radio, D-Star in contrast (seemingly) makes 220 more attainable.

D Star even through a node station i.e someone with D Star capability participating in the voice nets.....and for that matter other modes should be "nodes" n the voice nets as well i.e. those with HF capability, and even more specifically those that are CW and those that may do HF digital modes like PSK, RTTY and MT 63....should be incorporated into the existing nets and moreover the participants, both D Star and non D Star should have practice with this integration, with passing traffic both into and out of the D Star system as well as others.....and in my opinion should practice passing traffic in simulation where there is no D Star repeater functional nor any functional internet in the area....i.e.passing traffic simplex to an HF node that could get on one of the HF nets to get the stuff out of the area---- much like what might happen here on the coast with the advent of a Category 2+ hurricane hitting the area,no electricity or internet and and many or most of the local VHF/UHF repeaters down..... I have even thought of and am working on trying to incorporate some of the CW guys in this type of scheme here because hurricanes are huge static machines, many times making the HF bands almost unusable for anything other than CW.

>>> As HAMs we have so, so much choice, but ironically with all the options we don't seem to be able to meet on the same page as far as passing traffic which is weird. Its because of this most nets wind up doing the very slow 2 meter voice, message handling where the words are spelled out phonetically and while at least we can get the message across when other systems are down or unreliable, we really should be able to just zip the traffic to whoever digitally from computer to computer . but we cant . or can we?

Donald ~ N2VU

Thoughts??
Again thanks to all

527. IC-880H MONI SETTING

Yahoo group: DVAPDongle
Date: 2010-07-22 16:30:45 UTC
From: Wayne
Topic: 527 Message: 527

Greetings,
I have been working hard to get my Icom set up for use
with the DVAP dongle and I am almost there. My last problem to solve
is that currently, to hear audio I must push the moni button. When I
transmit I have to push the moni buttom again to hear the audio.
I have tried various menu changes to no avail. I know it's operator error and I am missing
something. Any thoughts out there?
Thanks,
Wayne

Mark,
Thanks for your response. I have made sure that the dv code squelch is off and under squelch delay it is set short by default. My AR-=ATT is off as well. Now I have continual squelch after I push in the moni button to hear the dvap ID. I should think that I would not have to keep switching the moni button to hear transmissions each time I transmit.
I am currently only trying to solve this locally before I try any reflectors again.
Fortunately I saved the setting of the radio before I started to adjust the squelch functions...back to the drawing board.

Mark,
As a follow up, I have reset the radio and I am back to my original config whereas the squelch is no longer open when I push the moni button.
However, I do have a D SQL showing on the top row of the display.
This must be what you are referring to.... back to the book :)

I use a tethered AT&T phone with my DVAP and laptop while mobile. I think Verizon has broader G3 coverage than AT&T, but I'm having no problems with AT&T service. They don't block it. If I weren't contractually obligated to AT&T, I might consider trying Verizon.

534. TX message not showing up on Dstar Dash boards

Yahoo group: DVAPDongle
Date: 2010-07-24 18:00:58 UTC
From: ka2ugz
Topic: 534 Message: 534

I have the IC-91AD and I usually have a TX message stored in the radio that shows where I am.

The message shows up on D-Dtar dashboards when I use other interfaces like Satoshi's board but not when I go thru DVAP.

Is this feature supported by DVAP?

Thanks de KA2UGZ Jay

Hello Wayne,

I have not heard from you on this group whether you are still struggling or not with the 880. What I would like to know is what frequency are you using with the DVAP? Is the radio on the same frequency when transmitting? Is the radio on the same frequency when receiving? Are there any indications above the frequency read-out on the 880 that you can tell us? If you have succeeded in making the 880 work, then you can ignore all of these questions.

I have a 92AD using the DVAPDongle. Being able to connect when I am out of range of a D-Star repeater is wonderful. I do, however, have the same problem that you describe.

When I call the repeater with mt radio, my call sign and connection show up on the local dashboard as well as the D-Star site. When I go through the DVAPP however, nothing shows up on the dashboards even though I am contacting people worldwide through the Reflectors.

Hi Vern. The gateway dashboards only show users in the last heard section that are transmitting on that gateway (both RF and directly connected DV Dongles/DVAPs/hotspots). If you transmit on a reflector, the users do not show up in all of the connected gateway dashboards.

Try connecting directly to a gateway and transmit. You should see yourself listed in the last heard list there.

I already have the latest drivers and still have the reported problem about half the time. There doesn't seem to be a pattern to when the problem will happen. It just does sometimes, and sometimes it doesn't. I always plug the DVAP into the same USB port so port recognition should not be the problem.

Robin and Tim,
I updated the FTDI driver to ver 2.6.0.0 dated 10/22/2009 but the problem still exists. When I start the DVAP tool the script that runs tells me that no FTDI device found. If I unplug and replug the DVAP it will discover it...

Hi Clay. If you would, please download:

http://opendstar.org/tools/ftdireg.bat

and run it both when it is not showing up and after you unplug/plug back in. Please send the output directly to me (not to the list).

Thanks,
Robin

From: Joey
Topic: 544 Message: 544

Hi Robin & the group,

On many repeaters I still can only connect in receive only for some reason with my dvap. Previously there were some DB issues but dstar-admins took care of that for me.

I'm correctly showing up, fwiw, on http://query.ki4swy.org/index.php

Any ideas?

Thanks,

Joey, NV0N

Hi Joey. Your callsign is still problematic in the G2 database. Your entry is missing in the sync_rip table. Probably the best thing to do right now is to have the admin of your registered system delete your entry. Then wait a day and re-register.

546. Re: TX message not showing up on Dstar Dash boards

Yahoo group: DVAPDongle
Date: 2010-07-29 00:12:08 UTC
From: JAY WHITE
Topic: 534 Message: 546

Here is an update on TX message not passing through:

When I monitor the dashboards I don't initially see the TX message after I am connected to either a repeater or a reflector. I get the voice confirmation that the link has happened and I see my callsign on the dashboard too but the TX message is not shown until AFTER I switch to cqcqcq.

It's like the L command makes the contact but all the information is not sent until I change the radio over to cqcqcq, then the TX message is displayed on the dashboards.

Hi All,

I am looking at getting into D-Star, but unable to access the local repeater from my house. I wonder if anyone can tell me the full funcionality of the NEW DVAP. I am happy that it has a Access Point and you need a D-Star handheld to access this, but if you do not have a D-Star handheld can u access the D-Star network by just using a PC Mic plugged into your soundcard

you cannot use a pc mic, only via rf. and it works very well.

I think you'd be needing a DV Dongle for that, if you don't have the d-star capable radio.
I'm like you, I can't access a d-star repeater from my location, and I already had the Icom IC-92AD handheld (had purchased it to experiment with d-star). I almost did handstands when I realized that the DVAP would give me full access to the d-star network from the comfort of my easy chair (or out on the deck, or in my backyard, etc) using that handheld.

For example, right now I'm listing to the Canadian d-star Net, and have just heard the last two check-ins from Australia and England. And voice quality is fantastic.

To get into D-Star without a radio you would then use the blue DV-Dongle. We look forward to hearing you on D-Star.

If you don't have a D-Star enabled transceiver the DVAP would be no use to you. You would be better getting yourself a DVdongle. That will give you access to the network (once you have registered on it) from your PC.

553. DVAP Install problem - linux

Yahoo group: DVAPDongle
Date: 2010-07-31 22:51:48 UTC
From: richark
Topic: 553 Message: 553

I've searched past messages, but can't seem to find an answer to a problem I'm seeing. I'm trying to get my DVAP working on a Linux machine, running Centos 5.5. When I try to launch the DVAPTool, I get this error message:

```
./DVAPTool: symbol lookup error:lib/libQtGui.so.4: undefined symbol: FcFreeTypeQueryFace
```

I've put the DVAPTool folder on the desktop and it looks like it found the library files in the lib directory. But I'm at a loss as to why the error.

Thanks
Kenny, KU7M

Hi Kenny. You may not have installed freetype when you installed the O/S. Run:

```
rpm -q -a |grep freetype
```

and make sure you have the packages installed. To install, run:

```
yum install freetype
yum install freetype-devel
```

Hi Kenny. The other issue might be that you have an early version of the fontconfig libraries. I've placed a copy of mine at:

http://opendstar.org/tools/fc.tgz

for download. If the freetype install does not fix the problem, try the library files in that tarball. (cd /; tar xzvf /tmp/fc.tgz)

Topic: 553 Message: 557

Robin,

Replacing the default fontconfig libraries with the version you made available for me solved the problem. It is odd nobody has hit this before, since I did a standard install of Centos just a couple weeks ago on this box. I did have freetype installed, version freetype-2.2.1-21.e15_3.

I'm not on the next set of problems. :-)

When I launch the app from the command line, I get this error:
Fontconfig error: Cannot load default config file

That is probably nothing important, but DVAP is also having problems talking to the DVAP device. I haven't done any searching on this problem yet, so if there is a standard answer, I'm sure I'll find it.

73,
Kenny

Here is the output:

```
[kennyr@centos DVAPTool]$ ./DVAPTool
Fontconfig error: Cannot load default config file
DVAPTool version 1.02
Restored parameters:
UserCallsign=KU7M
DVDevice=/dev/ttyUSB0
Frequency=146550000
SquelchLevel=-80
TxPowerLevel=10
O/S: Linux
FTDI serial device ttyUSB0 found (A6007EXK)
new frequency (146550000)
Callsign set to KU7M
Frequency set to 146550000
Found 1 FTDI device(s)
Callsign set to (KU7M)
Opening DVAP device /dev/ttyUSB0
Cannot open com port /dev/ttyUSB0
Cannot open DVTool device /dev/ttyUSB0
[kennyr@centos DVAPTool]$
```

Yahoo group: DVAPDongle
Date: 2010-08-01 14:15:44 UTC
From: richark
Topic: 553 Message: 558

Just wanted to let people know that I figured out my second problem. The box has locked down access to /dev/ttyUSB0, if I run DVAP as root, it is able to access the device fine. I'm now trying to figure out why adding my user account to the UUCP group didn't solve this problem. (My knowledge of Centos is lacking, I doubt I would have this problem on Ubuntu)

Thanks again for the help!
Kenny

Hi Jim. The Atom based windows systems use the same drivers as the other PC's. Perhaps you did not have internet connectivity when you first plugged in the DVAP. You should be able to download/install the drivers from the http://www.ftdi.com web site.

561. Strangle problem on Windows XP for DVAP

Yahoo group: DVAPDongle
Date: 2010-08-08 06:13:20 UTC
From: Ian VK2HK
Topic: 561 Message: 561

I have loaded the DVAP application onto several PC's including Vista, Windows 7 and some Windows XP, without any issues, I do have a desktop and a Laptop both running XP that are experiencing the same problem. The application installs/runs fine except when I try to change the frequency. When I plug the DVAP into the computers they find the drivers and I have downloaded the latest drivers, I have rebooted each unit several times now and even removed and reinstalled the driver but no matter what frequency I try to add I keep getting "invalid frequency" coming up, as I said this has happened on only these 2 systems, but they both run the DVDongle software fine. The frequencies are between 145 and 146Mhz although I have tried many.

Thanks

Ian

Subject: [DVAPDongle] Strangle problem on Windows XP for DVAP

I have loaded the DVAP application onto several PC's including Vista, Windows 7 and some Windows XP, without any issues, I do have a desktop and a Laptop both running XP that are experiencing the same problem. The application installs/runs fine except when I try to change the frequency. When I plug the DVAP into the computers they find the drivers and I have downloaded the latest drivers, I have rebooted each unit several times now and even removed and reinstalled the driver but no matter what frequency I try to add I keep getting "invalid frequency" coming up, as I said this has happened on only these 2 systems, but they both run the DVDongle software fine. The frequencies are between 145 and 146Mhz although I have tried many.

Thanks

I have two of these little guys, great little pc's. my dvap works fine on mine with one exception is occasionally I have to unplug the dvap and plug back in for it to recognize it. I've also had the same issue with my accer net books and different usb devices. seems to be something in the acer's as I've noted my asus netbook doesn't have this problem, so far.

I have just purchased a DVAP from Waters and Stanton, Hockley, Essex in England. I downloaded the DVAPtool and am able to connect my DVAP but the tool software does not give me any options to connect to reflectors or access points. I also have a DVdongle and its tool software does give me options to connect to the various reflectors and repeaters. I would be grateful for some help.

Hi David. As per the instructions, linking/unlinking is done using your radio. Did you read the "Using the DVAP" section at http://www.dvapdongle.com ? :)

Feel free to send a direct email if the instructions are not sufficiently clear.

David,

Please read this

http://www.dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP.html

You connect to reflectors using your radio. For instance, when I use my
DVAP I typically use a 91AD and i have memory banks programmed
specifically for it. Good luck!

My callsign GI4FUM should already be registered as I am running a hot spot MB6OH and am accessing the D-Star network through it. I also have a DVdongle and it too works fine via the network.

No problem Robin. I have a printout of that in front of me as I type this. Can I take you to the paragraph starting "Once the DV Access Point Dongle is opened, the Device Name and Serial Number fields should show data specific to the hardware you have opened - they do so there is no problem there.

Moving to the next paragraph "DVAPTool then makes a request to an Internet based D-STAR gateway name server." This is where I come unstuck because the software does not request an Internet based D-STAR gateway name server. It just tells me that I am connected to the internet but not to where I am connected.

Where am I going wrong?

From: xscope2000
Topic: 576 Message: 576

Hi,

When I got my callsign registered for use with the DVAP, I was advised that I should use it with an A at the end - i.e. "2E0CTH A"

Is this just a convention or is there a technical reason for this?

Thanks,

73

Chris Howard 2E0CTH.

Hi David. The request to the name server is done automatically by DVAPTool. This retrieves the list of currently available gateways/reflectors. It does not display this list since the link/unlink request comes from the URCALL field of your radio.

Once you have requested a link via your radio, it will show up in the DVAPTool window. You then change your URCALL field to "CQCQCQ " and then you can transmit.

Remember that once you have clicked on "Open" and received the pop up box, you can walk away from your PC. Everything else is done from your radio.

Hi Chris. You should register your callsign only. You then go into the terminal tab on the registration page and add terminals. You should always add a "space" entry. You can then add other entries like "A", "D", etc. A lot of folks are registering the "A" terminal for their DVAP and a "D" terminal for their DVDongle. While this really is only a convention, it does serve a purpose. When folks see the "A" or "D", they know that they cannot callsign route to you if they are using a radio to access their local gateway.

Subject: [ga_dstar] D-STAR Forums at Huntsville Hamfest

If you are planning to got to the Huntsville Hamfest this weekend, the Hamfest organizers have dedicated three hours of forum time to D-STAR. Beginning at 10:00am in the Madison Room in the adjacent Embassy Suites Hotel, the agenda is as follows:

Hour 1: Part 1: "DVAP / DV Dongle / D-PLUS / software packages", Robin Cutshaw, AA4RC. This presentation will review the new DV Access Point Dongle (DVAP) and show DV Dongle improvements, capabilities and use. In addition, Robin will cover DPLUS updates, new hardware, software and advanced capabilities.
Part 2: "D-STAR basics and DV Dongle/DVAP", John Davis WB4QDX, Georgia D-STAR. John will take attendees through an introduction of D-STAR and cover practices, current happenings, nets, using the internet gateway network and more.

Hour 2: "D-RATS, D-STAR digital data software", Scott Hartlage KF4PWI and John Davis WB4QDX. This presentation will review D-RATS software for data communications usingD-STAR radios. D-RATS use within amateur radio especially in emergency communications is expanding. Scott and John will provide an explanation of use and features including file transfers, practical scenarios, messaging, mapping, e-mail
support and show a live demo.

Hour 3: "D-STAR Administrator and advanced topics", Ken Adkisson, WB4FAY. This presentation will enable D-STAR server system administrators to discuss features, maintenance and practices of the D-STAR system. The speaker will also answer advanced questions and moderate discussion of advanced topics concerning D-STAR systems set up, use and operation.

Join us for all or any part of the Forums between 10:00am and 1:00pm. The D-STAR Forum will be in the Madison Room in the Embassy Suites Hotel adjacent to the South Hall of the Von Braun Center. Take the connecting bridge over to the Embassy Suites for the Forum.

Don't forget that WB4HRO B will be operating from the Hamfest 0n 440.7125 +5.0 MHz and WB4HRO A on 1284.45 -12 MHz. WB4HRO will be linked to REF030 C and A respectiviely during the Hamfest. Huntsville is also home to two excellent D-STAR repeaters with KI4PPF and W4WBC. Check our the repeater listings on www.dstarinfo.com to get repeater information. See you in Huntsville.

John WB4QDX

Excellent DVAP arrived here today and is working very well, i.e.
DVtools works fine.

However if I try to run DVUpdater 1.05, DVapUtil 1.02 or
DVapFMSetup1.02 I get the following error:

The ordinal 80 could not be located in the dynamic link library
FTD2XX.dll

The .dll is installed, so does anyone know what the problem might be?

Hi John. Please download/install the latest drivers from http://www.ftdichip.com/

This should fix your issue.

The error you are receiving shows the library is old. Updating the drivers has fixed this for all of the other users that had that problem.

Hello Robin and all,

Well I can now report that after a lot of messing about, hand installing .dll etc I have a set of drivers which now works. I don't know why they didn't install properly. I'm also a bit confused as there appears to be files with the same version number that are difference in both size and date.

Anyway problem over back to messing about with radios.

Topic: 582 Message: 588

Hello Robin,

Well something strange is happening here. If I go to the USB/Serial port in hardware manager, I'm running Vista by the way, and click on the port the driver tab tells me the driver version is 2.8.2.0

I installed the drivers from a file called CDM20802_Setup.exe, which on the port tab information from above tells me it has a date of 12th July 2010.

I then took your direction and went to www.ftdichip.com and downloaded CDM20802 WHQL Certified.zip and tried to install that, but I'm told I already have the latest version. However the site says these files were dated 11th August 2010. So there seems to be some difference on the date of the 'latest' files.

My next move will be to try and un-install the drivers that are there and try the other set, even though they have the same version number if not the same date!

If you have any other ideas.....

From: John
Topic: 589 Message: 589

I have DVAPTool 1.02 and have been running it for quite some time. Today when I try and connect to Reflector 001 it comes back with "Unknown Gateway". I can connect to the other reflectors with no issue. I have a icom 92AD and have made no changes to the programming. I never have had any issues with connecting to reflector 001 until today. Perhaps, are there any issues with the reflector? Any other suggestions?

From: n5vrp
Topic: 591 Message: 591

This is a great tool and device where I live with no gateways within 100+ miles of me. I have two basic questions.

1. Would it be possible to incorporate features of the DVdongle into the DVAP tool application? Namely, bit error rate, History Log, Data w/message send box, Record/Playback with user slection for storing the media file on hard drive or flash stick drive, and lastly GET Links/Gateways attached to attached node (REF001 C, etc.)?

Boy that was a lot....

2. Would it or can a DVAP device hardware maybe with a 500mw transmit be developed for UHF Dstar use. In other words, a UHF Version of the DVAPdongle device.

Dennis, N5VRP
I am very interested in all above issues and plans to purchase another DVAPdongle in another month or two beaming outside to others in my area.

73's
Good Work, excellent design. Could use a little more power(10w or so) though.

REF001 went down at 4:20 PM EDT, 4/20/2010. Until someone involved with that reflector says other wise, I am reading that a site visit may be required. Your DVAP is correct in stating "Unknown Gateway".

Robin is busy at the Huntsville hamfest this weekend. He has addressed some of the questions below either on the mailing list or at hamfest seminars, so I'll try to faithfully repeat his previous statements.

At 02:07 AM 8/21/2010, n5vrp wrote:
>1. Would it be possible to incorporate features of the DVdongle into the

Robin has playfully suggested that the device you're looking for already exists. It costs $450, and consists of:

1 - DV Dongle
1 - DVAP Dongle
1 - short piece of Duct Tape

Many of us already do that (without the duct tape). I usually have both plugged into my home computer. I'll take this to mean that he's not planning a combined single device.

>2. Would it or can a DVAP device hardware maybe with a 500mw transmit be
>developed for UHF Dstar use. In other words, a UHF Version of the
>DVAPdongle device....
>Good Work, excellent design. Could use a little more power(10w or so) though.

Robin carefully selected the 10mW spec to create a device that would give you coverage around your home, but have minimum impact on other spectrum users in your area. But if you can connect a rooftop antenna, you should see 1/2 mile or more coverage to a handheld.

For seriously higher power, you're looking at the HotSpot device, that can turn a regular FM radio into a D-STAR access point (not a D-STAR radio), running as much power as the radio can run (being aware that it may end up transmitting some long duty cycles).

It's not quite so plug-and-play, but there are a lot of them out there. Here are some links:
http://www.g7ltt.com/hotspot/
http://w9arp.com/hotspot/

As for UHF, Robin says "a lot of people have asked for that." I'm one of them - I'd much rather be operating the device on UHF. So that's probably on the list. Note that the HotSpot will work on any band radio you connect it to.

I'd quite like to see some sort of "reconnect if connection lost" option? (like in DVAR).

I have lost count how many times I have been monitoring a reflector (or so I thought).. only to eventually realise it actually timed out/disconnected some time back - DOH?

A tick box to replace endless mic keys would be real nice ;-)

601. Unable to query dongle device

Yahoo group: DVAPDongle
Date: 2010-08-22 21:20:15 UTC
From: xscope2000
Topic: 601 Message: 601

Hi,

I'm running DVAPtool 1.02 on my Ubuntu netbook and I've noticed, fairly consistently that when I click on "open" to connect to the DVAP, I get the message "Unable to query dongle device". If I then click "open" again, it seems to then connect fine.

Does this happen to anyone else?

Thanks,

Chris Howard - 2E0CTH

602. automatic reconnect

Yahoo group: DVAPDongle
Date: 2010-08-23 09:18:51 UTC
From: Urs Haechler
Topic: 602 Message: 602

I use the DVAP for several months. I would not miss the dongle anymore. Around the house QRV in d-star, great.

The DVAP has a small minus point for me. Missing an automatic reconnect. When the link will be interrupted due to bad internet connection or changing ip addresses on the repeater side. Most repeaters have a dynamic ip address which changes every 24 hours.
It would be great if in these cases, an automatic reconnect would be possible.

Donald,

Not sure what's your goal, but have you considered keeping the DVAP close to the computer and instead extending the antenna connexion? I have connected mine to my roof top antenna and it works great. I will eventually test how far I can reach but a 10dBi antenna will certainly give me far greater reach than the supplied 2in. one.

610. Re: [DVAPDongle] How long of a USB cable will work with the DVAP?

Yahoo group: DVAPDongle
Date: 2010-08-24 00:26:22 UTC
From: Brian Frobisher
Topic: 604 Message: 610

The cable that came with my DVAP is over 6' long.....

In practice, the USB specification limits the length of a cable between full speed devices to 5 meters (a little under 16 feet 5 inches). For a low speed device the limit is 3 meters (9 feet 10 inches)

Looks like you can go to 16' 5" if that rocks your boat.

Thanks Brian, so I take it that the DVAP would be considered a Full Speed device (??) As per: A1: In practice, the USB specification limits the length of a cable between full speed devices to 5 meters (a little under 16 feet 5 inches). For a low speed device the limit is 3 meters (9 feet 10 inches).

Hi Bob. Reflectors 001 and 030 are running a newer version of the reflector software. Your dongle/dvap connection cannot originate from the same IP address as a gateway. You tried to connect from the same IP as W3AGB.

Yup, happens to me all the time with my Ubuntu 10.04 workstation and the DVAP Tool 1.02. I've even gone as far as updating the DVAP firmware to 1.05, but it still fails to open the device the first time you click open. I've just grown accustomed to watching it fail and then clicking open again.

Maybe one of these days, I'll try running strace on the process.

It happens to me as well under Fedora 13, usually after I've connected or disconnected another USB <--> serial device.

I use mine on an Acer netbook all the time. Did you try unplugging the DVAP and plugging it back in? Make sure it is plugged in before you start DVAPTool.

628. DVAP not working since hooking up GPS mic

Yahoo group: DVAPDongle
Date: 2010-08-29 18:44:37 UTC
From: kb1obg
Topic: 628 Message: 628

Yesterday I got a GPS mic for my 92AD and went through the process of setting it up and being able to transmit my position and see it on jfindu. Now that I have disconnected the GPS mic from and radio and gone back into VFO mode to connect to my DVAP, it's not working properly.

What happens is, I connect to a local repeater here with a gateway and my DVAP says remote system linked, but it won't show me on dstarusers.org on the repeater status page or on the last station heard listing. All this used to work before setting up the GPS mic.

The DVAP tool shows me connected to the repeater, but I'm not apparently getting out through the gateway. Also, it seems to time out and disconnect me within seconds. Again, I never had any issues with the DVAP until configuring and using the GPS mic. Has anyone seen this before?

OK, I got DVAPTools 1.02 loaded into the emachines netbook running Windows 7 starter.The problem I ran into that the Internet Explorer would come with a message that would say "Internet Expolre has stopped working" I was able to load DVAPTool 1.02 by saving the program onto a usb drive from my desktop running windows xp. Not sure why but it works great now on the netbook.

Two different users put garbage characters in their my callsign field (one used a single quote character and the other used a backslash character). This was causing problems for the reporting program. I've updated the system so things should be back to normal now.

636. Good D-Star/DVAP websites

Yahoo group: DVAPDongle
Date: 2010-08-31 16:04:22 UTC
From: kg8nn
Topic: 636 Message: 636

I am looking for good D-Star Websites that help D-Star/DVAP users observe whats happening.
I am aware of the following sites:

Wealth of info, repeater directories, last heard etc.
http://www.dstarusers.org/

D-Star Net Listing
http://www.dstarinfo.com/Nets/Nets.aspx

D-Star Reflector List
http://www.dstarinfo.com/Reflectors/Reflectors.aspx

See what repeaters,DVDongles/DVAPs are on any of the 34 reflectors
http://ref017.dstargateway.org/

Reflector List
http://www.dstarinfo.com/Reflectors/Reflectors.aspx

Live Feed currently on Reflector 1C
http://www.radioreference.com/apps/audio/?feedId=1647

FTDI drivers
http://www.ftdichip.com/

Our Source for DVAP
http://dvapdongle.com

Are there any other real-time sites that monitor the D-Star reflectors/network?

Thanks, 73
KG8NN Steve

637. getting read-only response on certain reflectors and all rptrs

Yahoo group: DVAPDongle
Date: 2010-09-02 00:38:26 UTC
From: Scott
Topic: 637 Message: 637

I'm still new at this so pardon me if this is a dumb question. I don't understand it all yet.

I'm able to fully connect to certain reflectors (020, 034, 020, 002) but not to 001 (where I'm connected receive only).

With repeaters, the problem is simple - I can only connect R/O.

Has anyone else encountered this problem? Could this be an authentication issue? NOTE: It's been this way for at least a month.

638. Re: getting read-only response on certain reflectors and all rptrs

Hi Scott.

You logged into ref001 using "AC5LT A". You have a "space" terminal registered but no "A" terminal. If you go to your registration page and add the "A" initial entry to the terminal list, you will be able to log in with transmit. Alternatively, you could use "AC5LT " to log into ref001.

Thanks, Robin

That was it. It worked without the A, but I'll add an "A" terminal to my registration anyway.

I am also new having just gotten the DVAP this week as a gift from the XYL. I beleive i have set myself up properly according to what has been written in this thread.

I connect to REF001C and get R/O. I believe i've properly setup the terminal info.

Suggestions to look into?

Hi Kurt. You registered N9ZMO with a terminal "D". The "D" needs to be in the 8th character of the mycall field. You are currently placing the "D" in the 7th character. Also, it is good to register a "space" terminal as well. You can follow the instructions at http://www.dstargateway.org for adding the "space" entry.

Thanks Robin, that was the culprit and i've also registered space. Funny how one can miss the simple stuff like counting spaces at 2am :)

643. Errors showing up on the TX message field

Yahoo group: DVAPDongle
Date: 2010-09-03 15:18:21 UTC
From: ka2ugz
Topic: 643 Message: 643

I am noticing a pattern which might hint at the actual problem. Sometimes my DVAP will stay connected for hours or days with no problems or issues. Other times the laptop will crash, display a full text screen of dump information then clear the screen before it can be read. All crashes happen when interacting with the IC91AD or the mouse on the laptop.

Often I will have open the dashboard for the repeater I have connected thru. It is on these occasions I have noticed that my TX message, the one that I have stored in the IC91AD, is improperly displayed on the dashboard. Whenever I have noticed this error it is not long before the DVAP application unlinks by itself or the laptop crashes. A few of the crashes have coincided when I clicked the "refresh" icon on IE to see if a repaint of the dashboard would correct the TX message.

The normal TX message is: JAY - LONG ISLAND NY

What I frequently see is: JAY - LoLG ISLAND NY

A change in both case and characters; nothing is changed in the IC91AD TX message.

I made a new TX message in a new location in the IC91AD (keeping the old one) and it now reads: Jay - Long Island NY

I am seeing the same errors in the same positions! Jay - LoLg Island NY

Another observation that is (so far) less coordinated with crashes is the recognition of the DVAP on the first insertion to the laptop USB port. On occasions that the DVAP is inserted and blinks green that I start DVTOOL but don't receive the "you are using the most recent version..." dialog box, connections can not be established. When this happens, I stop DVTOOL, remove/replace the USB cable and try again. Upon successful connection the second try I "feel" that I will experience a crash or reboot.

If the first attempt is successful I "feel" this is when the stability will last more than a day.

Like I said, the correlation is not as strong as when I see data errors in the TX message.

I am trying to determine if something on my network is preventing the DVTOOL from checking the revision.

Just a thought that crossed my mind as I was reading your post. Don't rule out a USB issue. If you are using a USB hub, try not using it.

From: JAY WHITE
Topic: 644 Message: 645

That is a good idea; I am not using a USB hub but I can't rule out USB errors just yet. I will try the DVAP on another laptop and see if the results are the same.

Yesterday I did see the same anomaly on the W1NLK dashboard on another users TX message that was displayed on the dashboard. I was too late to contact them to determine what they were running.

Another observation that maybe related to errors: I was half-listening to some lively conversations (while watching TV) and at one point the DVAP screen was showing the same call sign when both guys talked. There was no R2D2 in the audio and only after a third guy joined in did the call signs show up correctly. I have no way of knowing if this is a local problem to my set up or maybe a bug in the DVAP.

All in all it works well for what is still some pretty young software.

I have been running the system more often this week in preparation for a "9/11 Always Remember" Special Event station next weekend. Our club will be operating as N1Y on HF/VHF/UHF and DSTAR on REF010 C.

Hi Jay. When a user keys up, the first thing that is sent is their stream header which includes their callsign info. If that header is somehow corrupted, the controller will substitute the last known good header. That will sometimes cause the header not to match the person talking. We see that here fairly frequently.

Hi there
Just sitting here imapatiently waiting for the postie to deliver my dvap. I am going to be using it with my ic-e91 which is loaded with the icf file from here http://www.gb3ok.com/gb7ok_downloads.html .
Is there anyone in the U.K. using this file on a 91 who can offer advice on setting it up to use the dvap, I, have read the getting started guide on the website and it looks pretty simple. But as it is not a ic-e92 which most people use, I, cant find much help out there and programming that radio without the lead and software is more complicated than a woman.
hope someone can help

Hi Robert,

I would also like to request this feature be considered for future software releases. Something like a command line parameter could allow a DV-AP system to be configured to auto connect in the event of power loss and restoration.

Hi Robert. I'll take a look. It seems that I did not add it for a reason. You probably already know that there are some command line flags now. They are:

-open (automatically open the device)
-device XXX (use device XXX)
-nolock (uncheck the lock callsign checkbox)
-frequency MMMKKKHHH (set the frequency)

Using a batch/shell script, you can have the DVAP ready to accept commands from your HT.

Robin, I think the one addition I would like to see especially since I'm on reflector 1C most of the time is that when the link drops that it automatically relinks on the last reflector it has in memory.? That would be the greatest to me.? Mark KB3Z

G'day Jamie,

When you fire up the DVAPTool application, click the OPEN button and then look at the DOS/Command type window and you'll see, amongst other stuff, the Device App Firmware Version, which on mine is currently v1.05 which a most of us have found to work the best. I'm not sure what version the DVAP's are now shipping with, but this is easily checked as per above.

It is certainly worth doing the update. Others may correct me if I'm wrong. But I've found v1.05 to work really well, with no dropouts or issues.

Enjoy!!

Cheers,

You can also click Help->About from the toolbar in the main window for version information (after clicking Open).

You should be running version 1.05 of the firmware.

Many thanks for the replies, I have now updated the firmware to the latest version. Loving the dvap its nice to be able to use d-star in my local area, when all the other hams are still bemoaning the loss of marconi's spark gap transmitter as a means of communication and are still hoping this new fangled fm repeater thingy doesnt take off :D

now off to find a laptop with a serial port and a lan adaptor in my junkroom so i can try this d-rats software a chap i was in qso with earlier mentioned

cheers

Hi Rob. Your subject says "Firmware" and your message says "software". These are two different things.

The current DVAP firmware version is 1.05.

The current DVAPTool software version for all platforms including the Mac is 1.02.

Hi Rob. Nope. The "software" is what you run on your computer. That is DVAPTool for the DVAP and the current version is 1.02. This has nothing to do with "firmware". The "firmware" is code that is downloaded into your DVAP's flash memory and runs the microprocessor on the DVAP. The "boot firmware" boots the DVAP and cannot be upgraded. The "app firmware" is the application that runs inside the DVAP. The current version is 1.05. Your's is 1.00 so it is quite old. You need to upgrade it.

Robin,
I went to this page. The software section offers a 1.02 for MAC

The other files look to be windows zip files. I don't think these will be compatible with my Mac running in Apple mode.

Rob

666. Realistic Linux/Hardware requirements for DVAP

Yahoo group: DVAPDongle
Date: 2010-09-16 21:10:19 UTC
From: ian_73wine
Topic: 666 Message: 666

Hello All-

Basic background:

I have a HP Pavilion, 1.3GHZ Celeron, 225MB Ram.

I would like to blow this laptop up and install/run linux, install DVAP at some point. This laptop only other function will be to do heavy internet surfing and emailing resumes in MS Word.

Question:

Is this dream scenario possible?

If "yes", then:

Which Distribution of Linux?
How will I get MS word on there?
Will I be able to install hp printer, and view pics with my digital camera?
Which frequency is commonly used with DVAP?

Thanks for all your help!!

-Ian

Well, it is certainly possible.

Sounds like this laptop may be a bit long in the tooth, but it will likely run some flavor of Linux. Just about all, if not all Linux distributions these days have what is called a live CD. You can boot from this CD and take a test drive to see what works best for you and on your hardware before you actually blow up your laptop. If you do a search on Linux distributions, you will find hundreds of places you can download the live CD ISO or the full release. Most distros are based on Red Hat or Fedora. Fedora is free as are most of the others. You might look at Ubuntu, it's very popular with beginners.

The fact that you ask what frequency the DVAP uses causes me to tell you that you will need a D-STAR HT. It runs anywhere in the 2 meter band.

Always like to someone wanting to get started with Linux. If you are serious about those MS Word resumes, you will need Open Office (free). The OO suite also saves as a PDF which is the way to go for your resume these days.

Good luck. Don't give up. I have Linux running on an old iBook with the Power PC chip.

Ian,

I run Ubuntu 10.04. You can create a CD and run Ubuntu from the CD to try it without installing it to your hard disk first. It will leave your hard drive and any Windows install untouched. http://www.ubuntu.com/desktop/get-ubuntu/download

Ubuntu will run with the 225MB RAM but 512MB would work better. Find the model number of your Pavilion and you should be able find out if you can add RAM and how much.

OpenOffice may come with Ubuntu or you can download it, but either way it is free and compatible with MS Word documents. With OpenOffice (not MS Word) you can export your resume as a PDF file. A much better (read only) way of sending your resume. Your HP printer should work fine but you didn't mention what model or how you plan to attach it.

I'm not familiar with a common DVAP 2 meter frequency. I would suggest you refer to the band plan for the simplex range and channel spacing. I use 147.585 Mhz, it is in the simplex range and not commonly used in my area.

You can down load the linux software for the DVAP at:
http://www.dvapdongle.com/downloads/DVAPTool-linux.tgz

Good luck,
Steve

Hi Peter. It is because you are using "G6VBJ A" and you have not registered an "A" terminal in the Icom G2 gateway software. Either register the "A" or remove it from your station callsign.

Hi Les

I have the same setup as you. I used this guide, which covers the basics much better than the IC-E92 manual:

http://www.ladstar.org/dvap.htm

Once I'd saved the UR and RPT settings I needed, I then set up a memory channel for each combination - one for CQCQCQ via the DVAP, one for linking to REF005A, the next for unlinking from REF005A, and so on. That will probably make more sense when you've looked at the guide on ladstar.org.

675. DVAP keepalive problem with repeaters

Yahoo group: DVAPDongle
Date: 2010-09-27 09:45:41 UTC
From: J. Moen
Topic: 675 Message: 675

I know a Ham with a DVAP who can connect to REF001 and REF014 for many hours, but when he connects to repeaters (examples: K0HAM B, W0CW B, K6MDD C), initially he can listen and talk ok, but after about a minute he gets the message "missed keepalive from gateway, count 1" and it keeps showing this message as it increments the count. When it gets to 16, he is disconnected from the repeater.

He has tested this using a wired internet connection (not wifi) from two different locations that use two different ISPs.

I've been told typically the keepalive message is caused by internet connection problems. The testing he's done suggest that's not the case here, but of course it's possible both locations and ISPs suffer from poor or unreliable throughput, or testing was done at both locations when other devices in the house were soaking up the bandwidth.

I find it interesting the reflectors are not giving him this message, but repeaters are. Anyone have any ideas?

Jim - K6JM

Hi Jim. Have the ham you know send me an email so I can walk him through downloading and running wireshark. This will allow monitoring of packets to help determine his problem.

679. Re: [DVAPDongle] IC-91AD Setup

Yahoo group: DVAPDongle
Date: 2010-09-29 20:16:53 UTC
From: J. Moen
Topic: 678 Message: 679

You don't really use a D-Star radio with the DV Dongle. The Dongle and it's software DVTool allow you to connect your computer via the internet to DPlus-enabled repeaters and reflectors, and using the PC's mike and speakers, you can listen and talk on those repeaters/reflectors without the need of a D-Star radio.

With your 91-AD, if you are close enough to a repeater, you can talk directly to it over RF. In this case you don't need the Dongle.

Some people purchase the DVAP (Digital Voice Access Point), which is a 10mw transceiver connected to the PC, plus a program called DVAPTool that connects via the internet to repeaters or reflectors, and they operate with a D-Star radio like the 91-AD. You could have your 91-AD tell the DVAPTool to link to some repeater, then talk to it via your 91AD In that case, you would need some configuration and memories set up in the 91AD.

But your note says you have a Dongle, not a DVAP. So, as I said, your 91-AD and Dongle have no need of each other.

It's easier to configure the 91-AD using a PC program and an appropriate cable. I have both the RS-91 program from ICOM, and the program of RT Systems. The ICOM program is connected to your Data port and allows both updating of memories and configuation settings, but also lets you operate the radio from the PC, including sending data over the slow speed data channel. The RT Systems program uses cloning mode, with their cable plugged into the radio's earphone jack. I understand there are some other programs now, one of them being CHIRP, but I have no experience with those.

OK, good. As Francis W1FJM pointed out, you can get the key info at
http://dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP.html

A few months ago I helped a friend program up a 91AD for use with his new DVAP. Here is what I suggested to him. When you want to link, change to the memory that has the link to the desired repeater or reflector, then press PTT briefly. After it links, change the memory back to the one with Your Callsign = CQCQCQ. Othewise everytime you transmit, you'll be asking it to re-link.

Jim - K6JM

Suggest you add something like the following memories to your 91AD. All of them will have the following set the same:
a.. Receive Frequency = the chosen 2 meter frequency for the DVAP
b.. Transmit Frequency = the same
c.. No offset
d.. Offset Direction = Simplex
e.. Operating Mode = DV
f.. RPT1 and RPT2 don't need to be filled in when you are using Simplex mode
g.. Name of memory position can be anything -- the following are just suggestions.
1. Name = DVAP
a.. Your Callsign = CQCQCQ
2. Name = Info
a.. Your Callsign = DVAP□□□I (□ means a space, so the command goes into position 8)
3. Name = Echo
a.. Your Callsign = DVAP□□□E
4. Name = Unlink
a.. Your Callsign = □□□□□□□U (that's 7 spaces, with a "U" in the 8th position)
5. Name = LnkRpt1B (xxxxxx port B) (where xxxxxx is the repeater's callsign)
a.. Your Callsign = xxxxxxBL (port is always position 7, "L" always position 8)
6. Name = LnkRpt2C (xxxxxx port C)
a.. Your Callsign = xxxxxxCL
7. Name = LinkR001C (Reflector 001C)
a.. Your Callsign = REF001CL
8. Name = LinkR014C (Reflector 014C)
a.. Your Callsign = REF014CL

684. New HTC EVO 4G Android phone(new application) and DVAP

Yahoo group: DVAPDongle
Date: 2010-10-02 15:24:18 UTC
From: Michael Aust
Topic: 675 Message: 684

Robin,
I have the DVAP and like it alot. Have used it on laptop when on travel.

I recently got an Android phone that the dvap can plug into its usb interface
the new HTC EVO 4G phone. I can use this phone to connect my laptop to
Wi-FIhot spots or via my Sprint carrier.

The HTC EVO 4G smart phone is great, most of the time I do not use the laptop
for internet access.

Be great if the was an application for the Android phones, since most now have
USB

interfaces which the DVAP could plug into.

Since I can use my laptop thru the usb interfaces between HTC EVO 4G
and my laptop, thought it would be a natural to just have a Andriod Smart phone
with the DVAP (no laptop).

It would be a super small package and a super feature for the DVAP!

Les,

Welcome to D-Star. Don't let the learning curve frustrate you. It'll all work out, there are many here who will help.

Do you have the SW, and if not, get it. The programming software makes all the difference in that it makes it so, so much easier to set up. Give us more details with regards to what you've done and what isnt working and (trusting that I can speak for several here) "we'll help you out"!

692. DV Access Point Problem

Yahoo group: DVAPDongle
Date: 2010-10-04 00:22:19 UTC
From: Del
Topic: 692 Message: 692

I purchased my DV Access Point at Dayton this year. Its been fun and have had no problems until today.
Then I click to open device the Tool software thinks everything is find, when I look at the window that tells me everything thats going one it just says
Ascp Device Stopped
Over and over again. Even if I have the software shut down the DV Access Point is going Nuts! The green led is almost always on flashing fast, thje red and yellow ones are on a lot but not solid I would say 80 % of the time just flashing and flashing.

Anyone have any ideas? I did try booting the computer (XP Pro 32 Bit) it had no effect.

Thanks for any help you can pass along.

695. Keep Alive Message

Yahoo group: DVAPDongle
Date: 2010-10-12 01:35:58 UTC
From: apollomaker
Topic: 695 Message: 695

Hello All ---

Just noticed for first time since starting up the DVAP here a few days ago, a message that appears in the Tool window which is....

"missed keep alive from gateway, count = 1"

Sometimes this appears more than once, maybe two or three times in sequence. Any clues as to what is causing this? Anything in my setup or is this a network/gateway/reflector issue?

Many Thanks for any help and info --- Bob / K6WL

696. Re: [DVAPDongle] Keep Alive Message

Topic: 695 Message: 696

When I posted this problem, Robin gave me the following info (quoting him):

The "missed keepalive" messages are normal as long as the count is low, 1 to 3. Larger numbers show that your internet connection is having problems.

Both DVTool and DVAPTool send a keepalive "I'm here" message every second to the connected system. The connected system also sends them back to you. If you miss a large number of these, you are disconnected.

If you are using wifi, you might try a wired connection. Also, some folks have remedied this by power cycling their internet router.

Bob, I can relate to your problem.? I think what needs to be developed is a DVAP that has all the software loaded as firmware? on the DVAP itself, and doing that would mean no need for a computer.? Thus you could connect your dvap directly to your router and thus eliminate or hope to eliminate the loss of the reflector.? Oh and by the way, my reflector losses are 99 % on reflector 1C. Cause that is the only one that has the most worldwide traffic.? Mark KB3Z

Hello All ------

Thanks for the replies. This is as I suspected. It is the result (apparently) of missed polling attempts. I did some more experimenting following my post. There was a bad run of it, then it went away totally so for the time being, I am just going to write it off as a connection issue on the Internet. I am NOT using WIFI on my DVAP setup --- hard wire all the way. Yes, WIFI could cause more delay problems, especially shared WIFI. I am on fast cable, which is very reliable and high speed 99% of the time. I have also run high-speed games (interactive) with heavy data exchange on top of the DVAP with no problems or missed polling as well.

Thanks again for the comments --- Regards, Bob, K6WL

I don't think it is the computer. It is most likely the internet connection between your computer and the reflector. I go for days connected to REF001 module C with no dropouts.

I should rephrase my comment.? No, I know it's not the computer but most people using a laptop with a dvap probably use WIFI.? So that makes it more likely to have a problem with the DVAP connected to a laptop then to a router.? Mark KB3Z

From: Nik Presser
Topic: 701 Message: 703

G'day Dean,

It should work fine as long as you keep a lid on RF levels. Keep the RF levels of your rig low and keep the DVAP and your laptop away from the vehicle Engine Control Unit and Body Control Module if fitted. The only thing that will kill your DVAP is stray RF from these things, otherwise you should be ok.

Cheers,

Subject: [DVAPDongle] Mobile broadband 3G DV AP operation

Group i was just wondering how well or if using my mobile broadband 3G in my car would work good with this DV AP. I will be using it mostly on my home network but when i go mobile it would be nice if i was able to use it while going down the road so i could get into the links using my mobile radio. Any insight on this product would be appreciated. i have a more than enough of a fast computer using dualcore and 2 gig of ram. My processor speed is 2.4ghz dualcore.

Thanks

Dean Meredith

704. Registration clarification

Topic: 704 Message: 704

Group,

I need help to understand if i am setup for using the DV AP device. I am registered on the gateway as my callsign KF9L but i have read in different places i need to register with the letter A in 8th position and also seen where when you register that you may need to register your callsign with a following dash and the what device your using in the description area when you register. Example KF9L-DVAP or KF9L-DVDONGLE I am just not for sure what i need to do if anything cause i am getting different stories. Like i said i am registered though as KF9L through the gateway system. Please help me by giving me step by step info on what to do if i need to do something or add something to my registration on the gateway. I dont get on here much so you can reply here and copy your text and email me at skycom291980@... as i check my email 2-3 times a day.

Thanks

Dean Meredith

That link is not answering my questions really. My post was asking if all i needed was to register my call or go back in to the gateway registration area and add something. I am getting more than one way told to me on what to do on getting the dvap setup with the gateway so the link you sent me isnt doing me any good. I was just wanting someone to confirm that if i have my callsign as KF9L registered on the gateway, is there anything else i need to do. As i said before, my callsign is already registered but again i seen somewhere about having to do more than just my callsign so thats why i am needing a step by step info on what to do if there is anymore that i need to do.
I have read in quite a few areas about the dvap and its not all that clear on what to do. I get my dvap tommorow on thursday and wanted to get ahead of myself so i will be ready for it.

Thanks

709. Re: [DVAPDongle] Mobile broadband 3G DV AP operation

Yahoo group: DVAPDongle
Date: 2010-10-21 03:21:37 UTC
From: Gary Pearce KN4AQ
Topic: 701 Message: 709

I use my DVAP on an Acer Netbook with a Verizon air card MiFi device. I have the DVAP connected to an external antenna on the roof of the car.

It works well when I'm using my HT in and around the car. If I use my 2820 mobile on 5 watts (antenna on the other side of the roof) I get reports that I'm breaking up or disappearing sometimes. That seems to be because I'm overloading the DVAP (the manual warns about that). Using the HT inside the car works better.

When in motion, the signal you get to and from the cell network will obviously affect your operation. If the cell signal drops, the DVAP will disconnect within about 20 seconds (watch the "keepalive" count in the "DOS" window). If the cell signal comes and goes, the DVAP will try to maintain the connection, but your signal will break up on the network.

I see data rates of about 29 kbps when actively transmitting or receiving on the DVAP. That's fairly low, so the air card can usually handle it even with a weak cell signal.

Dean,

As I understand the current protocol (or suggested way of doing things), you may want to also register your call followed by three spaces and an "A" (without the quotes). If you are using D-Star through a local repeater to a Reflector, you use your callsign without any supplemental letter. When you are on your DVAP, you then use your callsign with the supplemental "A". I don't know the rationale for this, but that's what was suggested to me when I bought my DVAP and I've seen a lot of other people doing it when on their DVAP.

From: Ken
Topic: 704 Message: 712

Dean, it looks to me like you're all set. You have a KF9L terminal set up, as well as a KF9L...A so you should be good to go. The only decision remaining is whether you set up the "A" call in your DVAP or stay with the KF9L in both the DVAP and radio.

I tried it both ways back when I obtained my DVAP, and for some reason (perhaps the DV message text in the radio wasn't getting through to the remote gateway, don't really remember), I settled on setting the DVAP up with the "A" callsign. The thing to remember is that if you configure a callsign in the DVAP that isn't registered on your home gateway, every connection you make will be read-only.

Dean:

I only have my call sign registered with the D-Star network. Unfortunately, I live about a 100 miles or more to the closest D-Star repeater so I am using the DVAP such as you will be doing. I contacted Milt Forsberg K9QZI. He set up the D-Star repeater W9YR for the Champaign/Urbana IL area. He was very helpful getting me going. I asked him about registering with the additional letters after the call sign and he said that nobody was doing that anymore. Although I see that online in the latest heard it really makes it a lot easier on programming your radio and getting linked to a reflector or a repeater. I have to watch my terminology as I am still learning about linking and connecting and such. I also see where W9UVI the Peoria Amateur Radio Club is having an open house on with seminars on D-Star, D-Star for Dummies. It was set for Friday November 12th but I see that they have changed it on their website to December now. I am planning on trying to attend that to see what I can learn. There are is also quite a bit regarding programming the radio on You Tube: http://www.youtube.com/watch?v=7-_MK_TKMfg

I hope that this helps. Feel free to contact me if I can be of any assistance.

The "A" must be in the 8th position. Not necessarily 3 spaces. The rational is to let people know that you are on a device that doesn't allow callsign routing. Therefore, people could not find you, via callsign routing, if you are on a DVAP or DVDongle. I recommend using a "D" in the 8th position of the callsign for the DVDongle.

Thanks for the clarification. You are correct -- the suffix letter goes in the eighth position. I gave him the specifics of three spaces as his callsign is only four characters.

Warmest regards,

Tim, AF1G

Hi,

I would love to use my dvap with my HTC Evo Android phone. Is there any way to make this happen?

Thanks!

Most mobile phones do not support USB powered attachments. Unless you have
some information that is contrary to this I would believe the same to be
true for the EVO.

From: Mike Besemer (WM4B)
Topic: 704 Message: 722

It's a shame that there is so much misinformation, disinformation, lack of information, and rumor about DSTAR. I've been a ham for over 35 years and have operated many different modes, and never have I had such a hard time gathering FACTUAL information.

I've always wanted not only to know HOW, but also WHY. It seems that DSTAR info is scattered to the winds and the info you can find seems to vary widely depending on the 'expert' who compiled the info.

FWIW, I have RTFM and the FM ain't all that and a bag of chips. I don't mind reading TFM, but I don't want to read ALL TFMs and I don't want the information in TFMs to be different.

Perhaps the Internet is partly to blame. it's too easy for everyone with an opinion to chime in and express their ideas as though they were facts. At any rate, it's frustrating the heck out of a lot of people and it's no surprise to me that folks (especially the ones who take time to research it before they take the plunge)are turned off by DSTAR.

My 2-cents worth.

Mike

The "A" must be in the 8th position. Not necessarily 3 spaces. The rational is to let people know that you are on a device that doesn't allow callsign routing. Therefore, people could not find you, via callsign routing, if you are on a DVAP or DVDongle. I recommend using a "D" in the 8th position of the callsign for the DVDongle.

wrote:

Dean,

As I understand the current protocol (or suggested way of doing things), you may want to also register your call followed by three spaces and an "A" (without the quotes). If you are using D-Star through a local repeater to a Reflector, you use your callsign without any supplemental letter. When you are on your DVAP, you then use your callsign with the supplemental "A". I don't know the rationale for this, but that's what was suggested to me when I bought my DVAP and I've seen a lot of other people doing it when on their DVAP.

I am registered on the gateway as my callsign KF9L but i have read in
different places i need to register with the letter A in 8th position and
also seen where when you register that you may need to register your
callsign with a following dash and the what device your using in the
description area when you register. Example KF9L-DVAP or KF9L-DVDONGLE
I am just not for sure what i need to do if anything cause i am getting
different stories. Like i said i am registered though as KF9L through the
gateway system. Please help me by giving me step by step info on what to do
if i need to do something or add something to my registration on the
gateway. I dont get on here much so you can reply here and copy your text

From: John Anderson
Topic: 704 Message: 723

Mike,

I agree completely. It seems there is a lot of "do this" info out there, with not a lot of why. Another thing the "information age" has brought with it, is the sometimes pretty snide comments that are made for no apparent reason. Guess that's just stereotypical of the Ham community, unfortunately. As to the question of why the suggestion to add the suffix, I suggest that the callsign routing explanation is only part of the issue. If one is linked into a given machine with the primary callsign, using a Dongle(AP), and does not unlink, but later goes active with, say, a mobile rig using the same callsign, then the system will have problems (bad sentence, too many commas). I am not an expert, but that's how it was explained to me, and it makes sense.

That link is not answering my questions really. My post was asking
if all i needed was to register my call or go back in to the gateway
registration area and add something. I am getting more than one way told to me
on what to do on getting the dvap setup with the gateway so the link you sent
me isnt doing me any good. I was just wanting someone to confirm that if i have
my callsign as KF9L registered on the gateway, is there anything else i need to
do. As i said before, my callsign is already registered but again i seen
somewhere about having to do more than just my callsign so thats why i am
needing a step by step info on what to do if there is anymore that i need to

do.

I have read in quite a few areas about the dvap and its not all
that clear on what to do. I get my dvap tommorow on thursday and wanted to get
ahead of myself so i will be ready for it.

Thanks

Dean Meredith

if i am setup for using the DV AP device. I am registered on the gateway as my
callsign KF9L but i have read in different places i need to register with
the letter A in 8th position and also seen where when you register that you may
need to register your callsign with a following dash and the what device your
using in the description area when you register. Example KF9L-DVAP or
KF9L-DVDONGLE I am just not for sure what i need to do
if anything cause i am getting different stories. Like i said i am registered
though as KF9L through the gateway system. Please help me by giving me step by
step info on what to do if i need to do something or add something to my
registration on the gateway. I dont get on here much so you can reply here and

copy your text and email me at skycom291980@ as i check my email
2-3 times a day.

Mike,
using your example there will NOT be a problem. The system knows where you LAST transmitted. Being linked has no bearing. The whole thing is about call sign routing. You cannot callsign to a user on a DVDONGLE nor DVAP. It doesn't work. If you use the same call on your dongle type devices and someone looks at DSTARUSERS.org, sees you on and tries to callsign route to you the system won't find you. If you use the "A" or "D" with your call, that will give them an indication that you can't be routed to.

Ah - but this is *if* they understand that's what it means!

IMO using A as the eight character is also confusing ...
as band modules use A, B and C. So when I see a call with
an A in the eight column - I think it's a repeater band module.

A couple of years ago out at one of the evening Dayton D-STAR
meetings it was mentioned that we'd have a central web site
with everything D-STAR ... but that really has not ever materialized.

Be nice if when there are standards and conventions that we
could have these all in a central place ... for both long
time users as well as people who are looking into or getting
started with D-STAR.

Well..

It's still a new mode and we're all learning what works and what doesn't. The Dongles are even newer than D-Star itself. As these things filter down and out, hopefully a recommended standard will evolve. Some things already have been standardized. In the meantime, keep experimenting and have fun. To use a common "dog-Latin" expression, "Illegitimus non carborundum." The correct Latin for that expression, in case you've ever wondered, is "Noli sinere te ab improbis opprimi."

Hi,
It works great!
I have used it in the Australian Outback, about 80km from the nearest phone tower and an old Pentium Mobile 1.2Ghz Laptop computer.
No issues at all.

From: kz1o
Topic: 730 Message: 730

While monitoring one of the reflectors here, using the DVAP and my IC-91, I noticed that often people will ID and say "listening" but I didn't exactly get their callsign. I look at the display on the radio and their call is gone, and the applet onscreen is empty as well. This is because a second or two has passed since they let up on their PTT.

It would be really nice to have a way to see the last five callsigns in a window somewhere that scrolls, so that I could see who just transmitted. Something like a DX cluster display would do the trick.

I can also see how it would be handy for a net control station to have, too.

Does such a file exist somewhere? For example, I could:

```
tail -f DVAP-callsigns.txt
```

and run that in a separate teeny window.

Thanks, 73,
Dave

Hi Dave,

It sounds like you are using your DVAP with linux.

By starting the application from a shell prompt, rather than from a desktop shortcut, the DVAPTool graphical window will appear, with a scrolling log of messages, including call signs, displayed within the shell window.

Kind regards and 73

Also, from a shell prompt you can add:
| tee dvaplog.txt

to the end of the command and it will output what goes to the shell screen to the file "dvaplog.txt".

Works just fine - both 32-bit and 64-bit. Make sure you have
the latest FTDI USB drivers. In the last week or so there have
been some FTDI driver updates provided through Windows Update.

Here's the source from the mfgr:
http://www.ftdichip.com/

738. DVAP and Mac OSX 10.6

Yahoo group: DVAPDongle
Date: 2010-10-30 03:40:13 UTC
From: Robert
Topic: 738 Message: 738

I have the DVAP tool working on my Macbook Pro laptop OSX 10.6.

I enjoy the system very much.

The problem I have is at times (quite frequently) my transmit will drop off after approx. 10 seconds. And, sometimes it will stay up for several minutes.

I have tried moving the unit about four feet further away from the laptop, There are no other devices running off the USB ports.

Any ideas?

73,
Robert/ki6ft

Hi Robert,

Have you determined if you are dealing with a radio problem or a computer problem?

One easy first step in troubleshooting DVAP-related issues is using a regular (analog) receiver, even a police scanner, tuned to 146.55 (or whatever freq you are using) just to see if everything is transmitting when you think they should be.

It would be good to know that you were not wasting time looking for a USB driver version mismatch when the problem was a low battery in your HT.

Also, may I ask how do you know that your "transmit will drop off"? Is it output power measured, or transmit LED, or did the receiving station say you are R2D2, or did receive audio come out of your radio while you were still talking? I'm not being a wise-guy here... I am only trying to identify the problem before trying to identify the solution.

All the best, and 73,
Dave

Hi Mark -- these are pretty common now -- SMA fittings --- available at many large electronic stores like Fry's (if you have them where you live) or order from distributors like Mouser or Digi-Key.

Good Luck -- Bob -- K6WL

From: N2OJD
Topic: 740 Message: 742

Check Radio Shack part number 278-010 for a right angle SMA connector, I have purchased them there about $7.
You can get them cheaper elsewhere but if that is all you get, you will spend more with shipping.

743. DVAPTool wish - Call finding / routing / echolink info

Yahoo group: DVAPDongle
Date: 2010-11-15 17:10:46 UTC
From: chris_spencer1
Topic: 743 Message: 743

Hi,

I'm new to DVAP and enjoying every bit of it. However there is a feature I would like to request if not already flagged for a future release.

Callsign query / routing?

Is it possible to have a feature that queries and reports a callsigns last heard or currently present connection on the dstar network e.g.
UR:callsign set on radio returns MSG 'callsign found REF???? /DVAP' or something or even just routes to where that callsign is connected or last heard, similair to repeater callsign routing via RF to a dstar repeater.

Also one more thing. I heard a rumour that it will eventually interface with Echolink. Is this true? How will it work and when is it scheduled?

I hope this is the right place to post...

While I am not opposed to feature-creep on the DVAP -- I personally would like to see script-execution on a DVAP host like what we can do with DPLUS on a gateway -- I'm wondering about the feasibility of a last-heard function on DVAP.

The function is already available on the last-heard pages on dstarusers.org with individual callsign information provided by the dstarmonitor process running on the gateways. If script-execution were implemented on the DVAP host, one could write a script to query DSU for a particular callsign. For those callsigns directly connected to reflectors, one could script a query to the reflectors themselves (refXXX.dstargateway.org) for the requested callsign.

Implementing this lookup on the DVAP host itself would require at least the MNG table to be imported from the postgres database of any particular Icom gateway, and the table would need to be updated in real-time, and there is currently no provision to do this.

And even this wouldn't get the reflector activity, there would need to be a separate process for that.

> Also one more thing. I heard a rumour that it will eventually interface with Echolink. Is this true? How will it work and when is it scheduled?

Oh, I certainly hope not... LOL.

Hi Carl. I just looked at the logs and the problem is your callsign. You are using "W8KRF C " (with the C in the 7th position) and should be using "W8KRF C" (the C goes in the 8th position).

The "your device installed..." is from when the communications drivers got loaded when you plugged in the device. The actual software for running the DVAP is available from www.DVAPDongle.com<http://www.DVAPDongle.com> - Downloads - DVAPTool - Windows

Hi Robin Correct I stopped at the driver install. Then went to next install and the msg on my Vista Netbook read File is not a valid Win 32 app.
So moved over to my intel OS Mac and set to WIN XP. Everything went fine I brought up the DV Tool Filled in call sign com port and frequency. When I close it It disapperas. The the only way to bring it back is by reloading the file. Still no Icon.

Bill,

If you are getting an invalid application app, then it sounds as if you might have a corrupted download. I'd suggest trying again. I know that the app runs on XP, Vista, Windows 7, both 32 and 64 bit versions.
There is no "Shortcut Icon" as many applications create. The application itself is the icon. So wherever you download it to is where you will have to run it from. You can create a shortcut or pin it to the start menu if you desire.
Also, there is no installation of the application, you just run it.

From: py2vr
Topic: 757 Message: 757

Hello Everyone,

I bought a DV-AP last week at AES Las Vegas. This morning I installed the DVAPtool and it's working very well, I didn't make tests at DSTAR Network yet but I think that will work. I am understanding how it work and how I need to configure it, but I imagine that I need to do like if I would be connecting direct a repeater, I think that.

Also it's a big pleasure to be a member at this group.

Best regards and 73s,

Eduardo - PY2VR

I think most of us use the frequency that comes out of the box. I would simply keep away from nearby repeater frequencies or frequencies known to be heavily used for calling or rag chewing. As far as those across the pond - don't violate any local regulations.

It really doesn't matter it only affects your ability to communicate with your DVAP.

Hello to all of you reading this thread,

I bought my DVAP last October and I am very happy with it. However I would prefer some more features/updates. But that is not the issue here.
In my country (The Netherlands, Europe) there are no 'consensus/recomendation' for using the DVAP. And to be honest with 10mW it is not very likely that anybody will be complaining about you causing QRN on whatever frequency, unless your nextdoor Naber also is a happy DVAP user ;-)
Because we are restricted to the use of 144-146 MHz on the Two meter band, the 'out of the box' frequency setting is no option for us over here.
Most of the NL-DVAP Dongles are at +/- 144.900 MHz. This also is the part of the band where our Packet Radio and APRS stations are sitting.
Until today I have not experienced any interference or lost D-Star packets on my frequency (144.83750 MHz)
To prevent this from happening I have sent out an email to our D-Star-union and asked them to agree with a couple of 'fixed' frequencies for DVAP Dongle users.

Just my 50cents

Regards,
Bert, PE1KZU (PA-region)

Hi Graham,

the agreed 2m simplex frequency for DV/D-Star in the UK (at variance with the rest of IARU R1) is 144.6125 MHz. Although this frequency is intended for simplex (back to back) QSOs, you'd be unlikely to cause problems with your DVAP if you live remotely and limit your handheld to super low/100mW, if possible. You may even hear occasional passing stations if you monitor 144.6125 routinely.

If 144.6125 MHz is in local use, the convention is to listen to the [largely] defunct 2m packet frequencies for a quiet channel.

Be sure to use the lock callsign function (default setting), so as to comply with the UK license regulations regarding the carriage of 3rd party traffic without a notice of variation (NoV) to your license.

>>> I suppose that eventually this will be addressed but I suspect that it hasn't because it hasn't been enough of an issue. Not to seem recalcitrant but especially if you're using the stock little antenna that came with the DVAP, you can pretty much park yourself wherever you want. I wonder if everyone with a DVAP uses the DVAP tool that you can download from the site, that gives you a band scope, where you can see the noise floor on the band so you can choose a quiet part of the band to assign the DVAP.

My range from the house with mine is about 800' feet (+/-) no one within that range is an issue.

Just my 50cents

>>> Wow, we really are in a new economy! :-)

From: Bob K0NR - email list
Topic: 758 Message: 767

Hi all,
First off, recognize that VHF usage and band plans are regional in nature. So don't expect one frequency that will work worldwide....or even across one continent. Second, the DVAP is designed to be a local hotspot, so choosing a frequency is more about avoiding interference in your (very) local area than having a standard frequency.

I agree with Dale's recommendation for the US (145.67 MHz) ....the freq is in the misc & experimental subband in the US.
It this frequency is actively used, you can move down to something like 145.60 MHz

If you are in the US, setting the DVAP frequency to 148.000 MHz actually puts
you out of band.
That is, the signal has some bandwidth to it, about 6 to 10 kHz, depending on
how you define it.

>I use 148.000 flat at the top of the band I never have any prob there
>
>Thanks,
>Mark West

Two things about that, Mark, assuming you're in the USA.

First, by using 148.000, you will be putting some energy outside the ham band so it's illegal). The D-STAR signal is about 7 kHz wide, and you put the center of that at 148.0. So about half your energy - 3.5 kHz worth, is outside the band. And it's not just for the 10 mW signal of the DVAP, it's your HT or mobile that you use to talk into it.

Second, 148.0 is within the passband of any 147.39 MHz repeater's input frequency (147.99 MHz). Maybe there is no 147.39 repeater around you, but you might tote the DVAP on a trip, keep using it there, and cause a problem. In general, it's "good amateur practice" to avoid using repeater inputs for any other use unless you really know what you're doing.

I shy away from any spectrum used for analog operation, since the D-STAR signal appears as "noise" to an analog user.

The spectrum between 145.51 and 145.79 is kind "no man's land," or maybe better said "any man's land." Here in the Southeast, SERA's band plan calls for packet, and there are packet systems here and there. Other regions of the country have specified other uses there, and a handful of groups have chosen one frequency or another in that spectrum for specialized activities on a local or regional basis.

Note that 145.79 was abandoned by the APRS network because it was within the passband of the ISS station on 145.800, so I'd avoid that worldwide.

I have my DVAP set for 145.65, 20 kHz down from the "D-STAR simplex channel" 145.67. When I'm on the road, I keep an ear on that for other incumbent activity before I use it.

Other channels to look at are those between 144.9 and 145.1 (again, packet in many areas, and some D-STAR repeater activity now), and 144.3 to 144.5. There are some entrenched users on some of those channels, like APRS on 144.39 and the ISS uplink on 144.49.

Again, the 10 mW output of the DVAP isn't likely to cause many problems, except when you connect it to a base station antenna - then it's good for many miles to a mobile, and maybe 20 miles to a good repeater. Your higher power HT or mobile signal is more likely to cause a problem to other spectrum users.

The FCC rule about "first come, first served" frequency usage is a minimum criterion. It's not enough to keep the various modes and users in our VHF/UHF spectrum working happily together. Our voluntary band plans bring us closer to that goal, but they also can't be so specific that every instance of use is accounted for. When individual users learn about the RF "landscape" they occupy, locally and globally, and make an effort to select their spectrum intelligently, we can all have fun.

Hello Eduardo,

I think you are asking about messages that indicate the status of a connection. The DVAP has both voice and text messages when you do a command such as linking or unlinking (among others). Each time you unkey with CQCQCQ in the UR field, there will be a text message of the link status. There is no voice message, which would not be practical, especially when in a qso.

Hi Ken!

Thanks for the suggestion.
In my opinion, i appreciate the "personal" use of DVAP that i think is the reason to have linited configurations dynamics on PC side.
But i think that any communication equipment should be stress the potential the technology is able to set, giving contribution by the way to system growth.

So i hope Robin will read this note and take care of needs and suggestions.
Any way my compliments for the good job done.

All the best,
73 de I1YRB

Not sure why people think they must register a terminal with the initial "A", even for DVAP. Just registering a terminal with your callsign should suffice just fine for most people, and is less confusing when you are beginning. You really only need multiple terminals registered if you plan to have multiple radios on the air simultaneously.

That said, here's a page that tells you all you need to know about registering.

Hi Mark,

Thanks for the information. Very helpful, I had 'registered' with a local gateway but neglected the important part of specifying terminal information and I updated that tonight. I assume it will take some time to get pushed out to other gateways and until then any connects will be receive only. I specified the initial "A" because it's recommended in the dvap dongle setup instructions online it is confusing but nothing major.

Thanks again.

Using the letter "A" in the 8th position with your call-sign for DVAP's was merely a designator that was recommended. Mark, N7MK, is correct in that your base call with a "space" for the 8th character is all that is really needed. For G2 call-sign routing purposes, you should always have your basic call registered. Adding other 8th position characters to your call is for personal preference.

> Thanks for the information. Very helpful, I had 'registered' with a local gateway but neglected the important part of specifying terminal information and I updated that tonight. I assume it will take some time to get pushed out to other gateways and until then any connects will be receive only. I specified the initial "A" because it's recommended in the dvap dongle setup instructions online it is confusing but nothing major.

Where this gets confusing (it seems for both novice and advanced users) is, if you use multiple terminals (ie, W1ABC and W1ABC A)... if someone does callsign routing to you, they have to make sure they are using the 'terminal name' of the radio you are currently using. In other words, if you are out of town, and using 'W1ABC A', but someone callsign routes to 'W1ABC' and the last place you used that callsign was on your home system, the call will get routed to your home system, even if you have been on all day at the system you are visiting with 'W1ABC A'.

I see some users on our system who have a different terminal for their home station, and their mobile station, and another yet for their mobile and then their dongle. So a callsign routed call has a pretty low probability of correctly finding them.

But then, how many people use, or even know how to use D-Star protocol callsign routing these days.

Hello Mark,

But then if someone callsign routes to someone using a DVAP it wont
get there anyway. As far as I'm concerned the 'A' just denotes you're
using a DVAP or dongle so don't bother trying to callsign route to me.

I do agree though that if you are using a system which accepts
callsign routing then just use your callsign, nothing else.

It is easier to manage without the suffix or Initial "A" the consensus seems to be if you're running more than one station/radio it's useful almost desired if not just enter "spaces" in the terminal registration fields. The confusion I had stems from Gateway not displaying the actual character in the initial field, seems to be a common issue across some posts, nevertheless thanks very much for the tips I've managed to connect and and I'm able to transmit.

The purpose of the indicator was to let people know they could not call sign
to you.

796. DVAP with Linux command line

Yahoo group: DVAPDongle
Date: 2010-12-07 14:14:41 UTC
From: pedro-y-pinacolada
Topic: 796 Message: 796

Hello,

I plan to use my DVAP with busybox linux.

My question is how to configure DVAP in command line, or conf file.

Hi there, don't know that install, but I run an HP mininote on Fedora core 7 and I run DVAP from the file manager. Works a charm. Just need the files suggested by dvapdongle.com for Linux and you should be set.

Best, David KC2WNW

It should be where you downloaded it to. The installer is inside the archive according to the install instructions on the web site http://www.dvapdongle.com/DV_Access_Point_Dongle/Installation.html

Aaron it's not really that hard. It's basically putting into memory the different reflectors which are accessible? to all on Dstar. Of course you need to pick a transmit and receive frequency which for example mine is 146.550. And in the memory channel you will set it for digital and then perhaps you can give a name to the particular channel such as Ill. Ref. 1c.? After that I would just follow what is in your manual.? Mark KB3Z

Aaron,

To just download the DVAP Tool is not enough ;-) . You have to install it by double clicking the DVAPTool Icon in your Downloads Folder.
After installation has finished you will find 'DVAPTool' under PLACES in the Applications Folder.

Aaron, I've got the DVAP installed on a Windows XP computer, a Windows 7 computer, and also my Macbook Pro laptop. It works on every piece of hardware I've tried (I'm the mad scientist, experimenting, don't you know....). On your Mac, look in the following area (not in the main Applications folder, it's in your own user account Application folder):

/Macintosh HD/Users/"your user account"/Applications

In "your user account" put your own account name. In the Application folder in your user account, you'll find - ta-da! - DVAPTool.app. Just double click on that and you'll be in business.

Regards:

Jan Timmers - VE7JBT

Aaron, Another thought borne of my experience with the 92AD and DVAP – I found the use of the programming/operating software for the IC-92D made the programming extremely simple and moreover, when the 92AD is left connected to your computer with the software running, you see a good deal of information about the stations/nodes being heard. If you are not portable you may find, as I did, that the information displayed by the software while operating is very instructive!

Subject: Re: [DVAPDongle] Need help Setting up my Icom 92AD For DVAP

Aaron it's not really that hard. It's basically putting into memory the different reflectors which are accessible to all on Dstar. Of course you need to pick a transmit and receive frequency which for example mine is 146.550. And in the memory channel you will set it for digital and then perhaps you can give a name to the particular channel such as Ill. Ref. 1c. After that I would just follow what is in your manual. Topic: 806 Message: 806

After taking my last road trip and only having a few D-Star stations along my route I decided to go ahead and purchase a DVAP and configure it for mobile usage. Thanks to the user group info, I was able to have some very successful testing yesterday (thanks to N5GQB and KE5YA for the QSO's on REF004B). So here is my setup:

- RF Rig is an IC-880H set to low power
- DVAP is plugged into an HP Mini 1000 netbook
- Netbook is running Ubuntu 10.10
- IP is provided via Verizon MiFi 2200 (WiFi to netbook)
- Power to the netbook is with small Radio Shack inverter

Looking forward to an extended 11+ hour road test when I take a Christmas vacation to northern Louisiana later this month.

Thanks again for keeping this yahoo group active with useful info.

Hi Ti-Michelle:

I'm pretty much resigned to the secondary status Macs get among the manufacturers, although that has been changing markedly in the past few years. For instance, if you do Digital HF, there is FL-Digi for many OS platforms. I'm pretty sure more hams are using Macs, based on what I hear on PSK31 and the other HF digital modes. And Robin AA4RC has helped us with a Mac DVAP binary (although the firmware updater is Windows-only).

So - keep the faith. For things like this I run XP under Parallels on the Mac - mostly as an appliance for software utilities like Icom's. The pain of using Windows is thus minimized, and I get the best of both worlds.

Michael.

Using this setup, how many miles were you able to traverse between dropouts etc?

I mean did your aircard keep up and running most of the time or did you have times when you had to reconnect and restart the DVAP software?

Thanks

I also use a Verizon mifi with a netbook and DVAP.

On the Interstates in the southeast (NC, SC) coverage is pretty good - 90% is my estimate. On US highways in rural areas, still pretty good. On local rural roads, there are some dark areas, but more coverage than you might think.

I don't have to reboot the DVAP just because cell coverage has dropped out and returned. But sometimes things will stall for no apparent reason, and a reboot will fix it. Not very often, and if I could watch the display while driving, "no apparent reason" may be more apparent.

Topic: 806 Message: 814

I have operated mobile DVAP with great success. On trips over the last year from Atlanta to Tallahassee, Orlando and Dayton, as long as there was cellular service, the DVAP worked great.

On the Tallahassee and Orlando trips, I was using an AT&T modem. AT&T's 3G coverage is limited to the major metro areas and some interstate corridors so getting off the beaten path usually means their slower EDGE and GPRS services. On the Tallahassee trip, I even encounter no AT&T service in parts of SW GA and north Florida.

Once my contract was up and with all the frustration of the lousy AT&T network, I moved over to Verizon. Because of the technology Verizon uses, their 3G service is integrated into all of their cell sites, so the "red" map is real and you get 3G service almost everywhere. It's not quite as fast as AT&T's HSPA 33G service, but plenty fast for DVAP operation and most everything else you would want to do.

I haven't tried or heard reports with Sprint, but they use the same CDMA/EV-DO technology as Verizon, it will just be coverage limitations of the smaller Sprint network. T-mobile 3G is the same techology as AT&T with limited 3G coverage and smaller footprint overall.

I'm anxious to try Verizon's new LTE service which blows everything away on speed, but it will be limited to major cities initially reverting back to 3G outside of these areas. Right now, Verizon is, IMHO, the choise for mobile data service.

Topic: 806 Message: 815

So far my longest single journey using DVAP is approximately 150 miles, one-way. Next week I will have a 10.5 hour drive for Christmas vacation. I didn't have an issue with having to restart DVAP (maybe an advantage of using Linux). I did experience an issue on the return trip with r2d2 on REF001C, but when I switched to REF004B I had a clear qso with NU5D. My guess is that it had more to do with network congestion caused by multiple DVAPs and Dongles on 1C.

Another suggestion is to use a MiFi (with WiFi connectivity to the netbook) rather than plugging a USB broadband card into the netbook. This puts less current drain on the netbook's USB ports and allows me to position the broadband device in an optimal place in the vehicle.

816. Strange thing with my DVAP

Yahoo group: DVAPDongle
Date: 2010-12-15 17:36:41 UTC
From: Jim Venables
Topic: 816 Message: 816

I'm having something that I feel is strange happening with my DVAP. I have a 92AD and it's all set up to use the DVAP and for the most part it works great. The problem that I keep getting is once I'm connected to the gateway of choice and just monitoring, once in a while it will be like I have tried to link again. What I mean is, it plays the remote system already linked file, as if I had pressed the PTT with the radio on that memory setting, but the radio is sitting by itself on the memory channel that I use to talk over the DVAP, with the URCall as CQCQCQ. This started since I updated the firmware of the DVAP, and I'm wondering if I'm the only one this is happening to or if it is happening to others as well. It's not really a problem, just an annoyance, but it makes me wonder if it's a sign of bigger problems.

Jim

Hi Jim;

My theory -- and it is only that, since I haven't yet seen any real good technical specs (nor even a block diagram) of the DVAP -- is that the packet header from the radio is mangled enough that the DVAP just uses the last known good header from the buffer. I've seen this on the gateways too, where one user will key up and the header info will be that of the previous radio heard.

Not much you can do about this except to make sure that your DVAP is hearing you well, keep the radio antenna in the same plane as the DVAP antenna, use adequate power to get in, key up about half a second before you talk, etc.

Robin or Moe or someone with intimate knowledge of the technology will have to comment on whether the header buffer is implemented in firmware or in the client software, and/or if that's what the problem really is / can be fixed, etc., but that's just my theory.

Hi Jim. When the header is corrupted in transit to the DVAP via RF, the DVAP will use the last known good header, just like a repeater. We decided it was better to use the last header than to completely drop the stream until you unkey (just like the repeater).

And you might want to make sure that you aren't too close (or too far) from the DVAP. If you are too close, you can overdrive the front end and cause issues.

That would make perfect sense if I were transmitting and getting a poor signal to the DVAP, but the radio is about 5 feet from the DVAP, and I'm not transmitting. I'm simply sitting here monitoring the repeater that I'm administrating.

If you have sufficient noise, you will get what looks like voice packet sync patterns. Try changing the frequency you use up/down a megahertz or so.

Hi Jim,

take a look at the red bar graph under the squelch control, as per the image below:

http://dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP_files/shapeimage_2.png

You make need to raise the squelch level (move the slider to the right).

Read the part again where I state that I'm not transmitting. It's pretty tough to overload a receiver when the transmitter is turned off!

828. Getting Registered

Yahoo group: DVAPDongle
Date: 2010-12-20 10:50:52 UTC
From: pennyrewob
Topic: 828 Message: 828

Hi all,

New to the DV world, but not to ham radio (licensed since '93).
I'm pretty confused by the 'registration' procedure, which seems to assume that anyone wanting registration, is within the capture area of a Dstar repeater!
I'm based out in SE Asia, working in air traffic control, but there is NO Dstar network anywhere in this country.

Unless I'm missing something, I can see no provision for a single entity, using a DV Dongle (my only link to Dstar along with my IC92AD).

Has anyone else managed to get registered, without needing to specify a repeater nearby, or is this going to be a 'private' aspect of the hobby (not what I got into the hobby for) ;-)

Working in government and military areas, I'm not really keen to share my personal details, other then name and callsign, so is that going to also present a problem?

I'm sorry to be appearing to moan for my first post, but if this registration procedure is going to be more trouble than it's worth, then I don't see much point in spending on a DV Dongle, if I can't use it for anything other than to listen.

Any help in getting 'on the system', will be greatly appreciated.

Have a great Xmas and 2011'

Paul

Hi Paul,

registering is straight forward enough once you have located the nearest repeater administrator; take a look here:

http://dstarusers.org/repeaters.php

To place your concerns in context: The registration requirements for EchoLink are FAR more intrusive/onerous (regardless of how you value your privacy) than the simple process for registration on the D-Star network.

Topic: 828 Message: 830

Paul,

I see and understand your point, though I don't know what to suggest as far as you registering "locally", however, with a DVAP or Hot-Spot you're able to enjoy D-Star more than those who just have a local repeater or two. Once you get registered and you have your HT and DVAP, you'll be able to connect to the many reflectors and repeaters around the world. It'll be like visiting any community you want (within reason) without leaving home. While I'll still get on some of the local repeaters to say hellow to some of the guys, and participate in our RACES drills, I can imagine evenr havin got give up D-Star!

Maybe you can register on a repeater close to your home in the USA where you would be when you are out of the service or your old home town.

Hi Paul,

DStar the intriguing and the unknown...coming to a radio near you.

The DVap is a great tool for what you're looking to do. You can register with ANY repeater and that gets you into the DStar system. Once you've been registered in the trust nothing else required and the network is open to your call. Think of it as a vetting process to only allow licensed operators use of the system.

Check this site for a listing of repeaters around the world. It defaults to the US machines but there's a pull down to select other countries.
<http://dstarusers.org/repeaters.php>

Here's another site that gives you the low down on the registration process. You only need your call, name and an email address for the process. so it's not like you're giving away the keys...
<http://www.dstargateway.org/D-Star_Registration.html>

Good luck!

Merry XMas...Happy 2011 to all!

Tom - W1TG

From: n2vu911
Topic: 835 Message: 835

I have two DVAP's and I really appreciate what they do, such simplicity and convenience, HOWEVER, my issue with them is that they constantly disconnect. Not immediately after establishing a connection but within hours they always seem to drop the connection. I've tried them on several computers, each using different operating systems and still the same result. I also know its not just me because I've heard the same gripe from other DVAP users. So, my question to the group is: Has anyone found a way to make them stay connected? Or, at the very least, can someone explain what it is that always causes them to drop the connection? I'd really appreciate any input.

I'll add that I have 3 hot spot boards from Mark Phillips, and I use them with the DVAR software, and I can declare that they never drop. When a connection is established, they stay□reliably□connected! If only the DVAP could do that too!

I look forward to any contributions to this query and I also wish all of you a great Holiday (whatever you celebrate).

Don, you are not the only one with the disconnect problems. It is the internet connection.? It seems that if you are running internet explorer or another program that draws from your internet connection it might cause a disconnect. Or if your internet connection has a bug for some reason that can cause an issue. The only solution I see is that if the software would reconnect you once a disconnect occurs that would be the best.? But we might wait a very long time before that will happen.? Mark KB3Z

Hi Donald,

I experienced the same over here and started to investigate what's wrong.
Because I am running DVAPTool on Linux it gives me the possibility to create some scripts to help me with my investigation.
After a couple of days I found my internet link (ADSL) to drop frequently.
Knowing this I called my provider and raised a ticket.
The next day the problem was solved and now I am fully enjoying my DVAP again.
But I keep my scripts running ;-)

You write that you tried the tool on several computers but I assume it's always the same internet connection?

Not immediately after establishing a connection but within hours they always seem to drop the connection. I've tried them on several computers, each using different operating systems and still the same result. I also know its not just me because I've heard the same gripe from other DVAP users. So, my question to the group is: Has anyone found a way to make them stay connected? Or, at the very least, can someone explain what it is that always causes them to drop the connection? I'd really appreciate any input.

I'll add that I have 3 hot spot boards from Mark Phillips, and I use them with the DVAR software, and I can declare that they never drop. When a connection is established, they stay?reliably?connected! If only the DVAP could do that too!

I look forward to any contributions to this query and I also wish all of you a great Holiday (whatever you celebrate).

Hi all,

Just a note to thank EVERYONE who responded to my appeal, and the speed at which I have been inducted into the 'brethren' (the paddling kinda hurt, but the stinging is going away now :-)).

To all that took the time to personally get in touch via email, another big thank you.

I've spent some time with my IC-E92D now, and programmed a few items into the Dstar side of things.

Contacted Universal Radio for a quote on shipping for the DVAP, and got a reply from 'Rick', who tells me that they no longer ship overseas - darn!
HRO have a minimum $75 shipping fee, so that went out the window too.

I just bid on a DVAP on Ebay, and after placing my $150 bid, read the item more carefully and find that the seller doesn't ship outside the lower 48!

Gonna keep searching, and I'm really looking forward to catching you on 'the air' when something actually comes up in the DVAP dept. at the right price.

Meanwhile, I'll wish everyone a very happy and peaceful Xmas, and a very productive and happy New Year for 2011.

Thanks again
Paul
XU7AEJ (prev. XU7ADQ)

Oh yeah...
As regards Tallahassee, I never got over that way, only went north on US95 as far as Savannah in the nine visits I've had.
But I agree with the Florida friendliness, and would like to pop over there again some time (it'll be cheaper now the kids aren't in tow with DisneyWorld at $66 each per day!!).

Subject: Re: [DVAPDongle] So what's with the constant disconnects with DVAP's?

Hi Donald,

I experienced the same over here and started to investigate what's wrong. Because I am running DVAPTool on Linux it gives me the possibility to create some scripts to help me with my investigation.
After a couple of days I found my internet link (ADSL) to drop frequently. Knowing this I called my provider and raised a ticket.
The next day the problem was solved and now I am fully enjoying my DVAP again.
But I keep my scripts running ;-)

You write that you tried the tool on several computers but I assume it's always the same internet connection?

Hi Donald. The hotspot software drops at the same rate as the dvaptool software. They have an "auto reconnect" feature built in so you don't really notice it as much.

There is a downside to the auto reconnect. Most drops are due to internet problems between you and the connected system, usually closer to your end. If your connection is sufficiently flaky that you often drop, that will probably impact your audio quality when you transmit. This can cause dropped packets and choppy audio. You've probably heard folks that sounded like that.

I elected to not auto reconnect so that users with problematic internet would not make the rest of the connected users suffer. This prompts users to try to work with their internet providers and try to resolve the problem.

I'm considering a solution somewhere in between "always" and "never" reconnect. If you just drop the connection every now and then, it would auto reconnect. If it is a constant problem, it would not auto reconnect. In that way, most users would stay connected while problematic users would not.

Hello Donald and Robin,

First things first; I am sorry Robin the only message I got from my provider is that they have reset the link. However very often they don't tell you what exactly went wrong. So to me this is a message like: "We've rebooted Windows"...
That's why I keep my monitoring script running ;-)

Robin: I understand and respect your reasons to not auto reconnect the DVAPTool software. But would it be possible to add a "reconnect button" to the Tool?
I own a IC92D and it really is frustrating when you have to use the [9] [6] [Control Dial] [5] and [PTT] key over and over again to reconnect when you're faceing a flaky connection. Also a button to connect and a pick-list would be very welcome 8-)

Don, you are not the only one with the disconnect problems. It is the internet connection. It seems that if you are running internet explorer or another program that draws from your internet connection it might cause a disconnect. Or if your internet connection has a bug for some reason that can cause an issue. The only solution I see is that if the software would reconnect you once a disconnect occurs that would be the best. But we might wait a very long time before that will happen. Mark KB3Z

Yahoo group: DVAPDongle
Date: 2010-12-24 12:10:25 UTC
From: Donald James
Topic: 841 Message: 848

Hi Bruce,

I have three hot-spots and two DVAP's, which is to say I have "experience" with both options. The DVAP is the easiest way to enjoy the world of D-Star - as in plug and play! Though as easy as the DVAP is, as you can imagine, your range will be limited with only 10 mw out, however don't underestimate what you can accomplish with that much power. There are many who have their DVAp's connected to a high-gain, outdoor antenna and get as much as 5 to 7 miles out of their DVAP! Thos are extreme examples but they exist. The front end of the DVAP's are as hot as any radio, its just a matter of getting the signal out.

If you want rage and want to snub that guys that are excluding YOU from their repeater, then I'd suggest a hot-spot, which will use an actual radio with anywhere from 10 to 25 to whatever number of watts you establish as part of the system you put together. This way you'll be able to drive around town, aside from be at home and connect to the systems (reflectors and/or repeaters) of your choice. Just know in advance that Hot-spot boards can be temperamental. Either way, I suggest to anyone who's into D-Star to get a DVAP or Hot-Spot to really get to know the D-Star experience. To just know it through the local repeater is not to know it at all. I'll analogize by saying that it's the difference between knowing just the 2 or 3 local channels, Vs someone having the 500 channels from Cable or Satellite - get the picture??

I sincerely wish everyone here a great Holiday!

My replies follow the ">>>" Below.

From: DVAPDongle@yahoogroups.com [mailto:DVAPDongle@yahoogroups.com] On Behalf Of aa4rc
Sent: Thursday, December 23, 2010 9:40 AM
To: DVAPDongle@yahoogroups.com
Subject: [DVAPDongle] Re: So what's with the constant disconnects with DVAP's?

Hi Donald. The hotspot software drops at the same rate as the dvaptool software. They have an "auto reconnect" feature built in so you don't really notice it as much.

>>> I have three Hot-Spot boards and they're the same in that with the DVAR software they seem rock solid as far as the connections go in contrast to the DVAP's. Yes, I do have the reconnect feature set in the DVAR software but if/when it happens that it needs to do that I've literally never seen it have to. As for the DVAP, I'll wonder why there's no traffic on the repeater or reflector that I'm on and then come to realize that it's no longer connected.

There is a downside to the auto reconnect. Most drops are due to internet problems between you and the connected system, usually closer to your end. If your connection is sufficiently flaky that you often drop, that will probably impact your audio quality when you transmit. This can cause dropped packets and choppy audio. You've probably heard folks that sounded like that.

>>> Yeah, though there are so many reasons why someone drops out. Its often on one side where there are what seems to be packet loss or other examples of latency or phase cancellation in the signal and meanwhile EVERYONE ELSE is hearing both sides of the conversation perfectly. As I was saying to a few on the REF020A yesterday, its amazing how problematic and vulnerable D-Star is. I've certainly embraced it, like I said, I have three hot-spots and two DVAPs, but I can also tell you that P25 pisses all over D-Star as far as a reliable mode of digital radio is concerned!! Yeah, I know, it's another league but in contrast the difference is HUGE!

I elected to not auto reconnect so that users with problematic internet would not make the rest of the connected users suffer. This prompts users to try to work with their internet providers and try to resolve the problem.

>>> If only our issues and complaints got real reactions from our providers and not generic responses. I used to call them and then realized how naive I was being.

I'm considering a solution somewhere in between "always" and "never" reconnect. If you just drop the connection every now and then, it would auto reconnect. If it is a constant problem, it would not auto reconnect. In that way, most users would stay connected while problematic users would not.

>>> No, it's not as though I loose the connection a couple of times an hour, it's better than that but either way, it would be such a plus if the DVAP would have auto connect. Thanks for your reply Robin.

For this short range, the DVAP is ideal. It's 10 milliwatt transmitter gives you a few hundred feet coverage. Add a bigger external antenna (it has an SMA connector) for a little more range - about a mile with a house-mounted base station antenna.

The DVDongle is an alternative. It ties you to operating from your computer, but you can bop between repeaters/reflectors faster, and it gives you more information/feedback on what the repeater/reflectors are doing.

If you find you really like D-STAR, you'll eventually want both. One PC can run both devices at the same time.

>I also wonder if the Dutch Star board is the same...

It connects your computer to an FM radio thru the 9600 baud packet port of the radio, and lets you use that radio as a "relay" for your HT or mobile D-STAR signal into the Internet. In operation, it's the same as the DVAP, but gives you the greater range and better receive selectivity of a full-power mobile radio.

Don't leave the radio in full power, though. It can end up making extended transmissions when connected to a busy reflector, and the radios aren't designed for full-power, continuous transmitting. BTW, it does NOT turn your FM radio into a D-STAR radio - you still need a D-STAR radio to generate the digital data. The FM radio is only a pass-thru device from RF to the Internet.

>or would I need to use a Cross Band Repeat Radio to do the same ?
>Any suggestions, comments and advice would be appreciated.

The ICOM IC-2820 will do crossband repeat of D-STAR signals. Other radios may - I know my Yaesu 8900 does NOT.

Crossband repeat requires being in range of a D-STAR repeater, and as you mentioned, it ties up the repeater. It these days of low usage on most repeaters, that may not be such a bad thing, as most repeater owners would like to see more activity.

Crossband repeat is the most expensive, least flexible option, but the radio has many other uses, of course.

I have all three alternatives, and pick the one that will best do whatever
I want to do at the time.

Thanks for your tip and thinking with me Tim,

I also have 'link' and 'unlink' memory channels in my E92D. But still....
There is a much more convenient way -> the DVAPTool.
Hopefully Robin will consider this option.

Hello Donald and Robin,

First things first; I am sorry Robin the only message I got from my provider is that they have reset the link. However very often they don't tell you what exactly went wrong. So to me this is a message like: "We've rebooted Windows"...
That's why I keep my monitoring script running ;-)

Robin: I understand and respect your reasons to not auto reconnect the DVAPTool software.
But would it be possible to add a "reconnect button" to the Tool?
I own a IC92D and it really is frustrating when you have to use the [9] [6] [Control Dial] [5] and [PTT] key over and over again to reconnect when you're faceing a flaky connection.
Also a button to connect and a pick-list would be very welcome 8-)

Hi Donald. The hotspot software drops at the same rate as the dvaptool software. They have an "auto reconnect" feature built in so you don't really notice it as much.

There is a downside to the auto reconnect. Most drops are due to internet problems between you and the connected system, usually closer to your end. If your connection is sufficiently flaky that you often drop, that will probably impact your audio quality when you transmit. This can cause dropped packets and choppy audio. You've probably heard folks that sounded like that.

I elected to not auto reconnect so that users with problematic internet would not make the rest of the connected users suffer. This prompts users to try to work with their internet providers and try to resolve the problem.

I'm considering a solution somewhere in between "always" and "never" reconnect. If you just drop the connection every now and then, it would auto reconnect. If it is a constant problem, it would not auto reconnect. In that way, most users would stay connected while problematic users would not.

Hi David,

Also of note, you should be able to use your call sign without any suffix
letter in the my call box of the DVAP software without any negative effects.
That is how my setup is currently and I have no issue with connectivity.

Hello David,

You are right. Using the DVAP without a suffix letter has no negative effects.
But here in PA-country we agreed to use a suffix letter to show the band we're operating in.
Amateurs that own a Repeater, Hotspot or DVAP add A, B, C or D to their callsign.
A for 23cm, B for 70cm and C for 2mtr band.
We are still arguing about using the letter D.
Some of us are adding the letter D to show that they are 'Dongle users' others say that the letter D does not represent the band the dongle is operating in.
Also they say that the DVAP strips the "/TEXT" and replaces it by "/DVAP" which makes using the "D" futile.
I have registrerd both "PE1KZU C" and "PE1KZU D". Currently I use the latter because "everybody" knows that dongles only operate in the 2mtr band :-D

From your QTH, I see a lot more than just 2 repeaters listed.

W4RNT 3 mi
KJ4ARB 7 mi
W4ICY 18 mi
NI4CE 19 mi
N4CLL 20 mi
KJ4BYI 22 mi

As far as the DVAP vs some of the D-STAR boards, well, the DVAP plugs in and you are working in just a few minutes. The other devices will all need to be connected to a radio and adjusted appropriately and then load the software, definitely not plug and play.

To: DVAPDongle@yahoogroups.com
Subject: [DVAPDongle] advice / opinions

I have a IC-92AD HT and the closest D-Star repeater closest to me has a unfriendly owner who only wants his group of friends to use it. The next closest repeater is almost to far to connect with a HT. I also would like to avoid tieing up a repeater linking to reflectors so I am considering to buy a DVAP to connect to repeaters and reflectors with the computer and then use the HT any where in the house or yard. I also wonder if the Dutch Star board is the same or would I need to use a Cross Band Repeat Radio to do the same ?
Amy suggestions, comments and advice would be appreciated.

Thank You

Hello All,

On this subject; over the holidays I've been watching the screen a little more than I normally do.

I have what I consider to be a fairly good Internet connection, but I also suffer lots of disconnections, especially on Reflector 5.

Anyway watching the screen I see the odd; "Missed keep alive request" but if it ever gets above a count of 2 the process seems to get on an unstopable roll and the next keep alive requests pour in one after the other and I'm disconnected within seconds. Shouldn't the keep alive requests be more spread out rather than coming all at once?

Hi John. The keepalive packets are sent from both ends, one per second. The "all at once" you see is due to a block of all the packets in one direction or the other. If too many are missed in a row, the connection is dropped. When a keepalive packet is received, the counter is reset to zero.

Bruce,

I purchased a DVAP a few days ago also. I was confused about it too. The manager at HRO in Atlanta, Mark KJ4VO was a big help. Mark had sent me a file by email to program my new IC80AD a few days earlier. The file was mainly for the Georgia area. But with the file and the DVAP settings preprogrammed in the file itself, he was able to walk me through the set up by telephone and we checked it out over RF. I think there is an HRO in Orlando. I am new at DSTAR myself. So, I suggest you contact HRO in Orlando or Atlanta. Also, review the following website: http://www.dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP.html

You appear to have registered two Terminals for AJ4WA, one with an "A" at the end and one with a "B" (and none with a "C").

The "A" probably should have worked (though I think those are used mostly for repeaters, and that might be the problem). You might try registering a terminal with NO 8th character and see how that works. Keep it simple.

And keep in mind that after you register, it can take hours before all the repeaters know about your new "identity." It won't work right away.

Hi David.

The DVAP is very different than the DV Dongle. It does not have the AMBE codec chip (since your radio already has one). As a result, it does not have DV Dongle functionality.

From: James
Topic: 859 Message: 867

Hello Bruce,

My turn to try and figure this out. Because I heard you on the Southeast Weather Net with your callsign of KJ4WA in your radio, I believe your call is correctly programmed, if that is the radio you are using. What I would check is your callsign in the Station Callsign field of the DVAP Tool software. According to your terminals that you have available at this moment, you can use "AJ4WA", "AJ4WA A" or "AJ4WA B". Note that two spaces would be required to put the suffix letter of A or B into the 8th position of the Station Callsign field. Getting a receive only message is an indication of an unregistered callsign (not your situation)or miss-typed call (that includes the character in the 8th postion if you are using one).

For additional help, you can contact AES Orlando or HRO Atlanta. There are fellow hams at both stores that can help walk you through this.

Good trouble shooting,

James, N0XIA
Orlando, FL

Hello Bruce,

First, you did not make a mistake by buying the DVAP dongle.
I bought it last September and I love it!
When I started the only info I had was to go to http://www.dvapdongle.com/ and download the software.
It took me some time before I learned, and found, a local Website where I could register my DVAPdongle.
But eventually I succeeded and registered 3 calls;
PE1KZU
PE1KZU C
PE1KZU D

Currently I have put 'PE1KZU D' in the Station Callsign field of my DVAPTool software.
I can also use one of the other registered call signs, but one at a time.

I assume you have checked that there is a blue LED is blinking once the DVAPTool is operational?
The DVAPdongle actually is a piece of electronics and sometimes they regretfully tend to break :-(

Thanks, Robin—as I figured. For complete failsafe, I guess I'll get a DVDongle, since no one gifted me with the Icom 9100 {;-)

Best, David

870. Updating DVAP Firmware on Mac

Yahoo group: DVAPDongle
Date: 2011-01-04 22:17:49 UTC
From: k6brr
Topic: 870 Message: 870

Hi All

I've scanned the posts and haven't seen anything that specifically addresses my issue.

I purchased a DVAP last week and had a great two days of usage. Then the DVAP would drop the connection but I could quit out of the program and reconnect but that really messes up a nice QSO.

I was informed that I needed to update the DVAP Dongle firmware from Windows - I connected the DVAP to a Windows laptop and ran the software that I downloaded from here:

http://dvapdongle.com/DV_Access_Point_Dongle/Downloads.html

and ran:

DvapUpdater 1.05: (zip archive of the DVAP firmware updater program)

but after I ran the DvapUpdater105 the boot firmware does not update.

AppRev 1.05
BootRev 1.02

The laptop is a current consumer Dell model but it is running Windows Vista Home Premium (an obtuse abomination of an OS) but that's what I'm stuck with.

Will running the updater on a laptop running XP solve this issue?

Do I need to go outside and face Redmond when I do the update?

Thanks & 73,
Dana Jones

Hi Dana. You are at the current revision level. There have been several posts recently about dropped connections. This is usually an internet issue. Take a look at the posts and see if they help.

Thanks, Robin.

After posting yesterday evening I restarted my access point and router. Stability seems improved.

Good to know that the firmware is where it needs to be. I was concerned by the BootRev value - now I'm not.

I appreciate the prompt reply. Great job on the DVAP. Really extends my reach from the backwoods!

From: Mushtaq
Topic: 874 Message: 874

Dear fellows,
Two days ago I bought the DV Access Point Dangle it works fine with repeater and Reflector around the world. I have a question, while I am connected to a Node by DVAP why my callsign is reported to my home DSTAR Node LD1OT?
My HT Radio
ICOM IC-E92D has the following setting:
Frequency Mode Your RPT1 RPT2
144.82500 DV VK2RDSCL DIRECT DIRECT

Is anyone can help me why my callsign been reported at my home DSTAR Node?
Thanks you!
73 de Mushtaq / LA3RIA

What do you mean "reported to you home repeater?" Where is it getting reported to?
Is the repeater hooked up to the same reflector that you have the DVAP connected to?

Well, I will try to explain again, my home DSTAR repeater LD1OT is not linked with any reflector. While I am linked with e.g. Reflector 001, I can see my callsign been heard at LD1OT, even I am not connected with the LD1OT? Can you please explain to me why this happen?

I would assume that your home DSTAR repeater is reading your RF signal?
Your callsign beeing read by a repeater does not necessarily mean that it has to be connected to a reflector only that it is a repeater capable off receiving and converting D* digital signals.

Dag Wout,

I don't know what the problem is with your DVAPTool and SuSe. My O/S is Ubuntu and DVAPTool works just fine here. All I can do to help you is send a listing of my files and permissions.
After installing my DVAPTool also appeared on my Desktop but I have moved it and it still works fine.
Ik hoop dat je er iets aan hebt ;-)
This what I have got after installing the DVAPTool;

```
ls -laR
.:

880. Configuration question on the call sign lock and "A" at the end of call sign

Yahoo group: DVAPDongle
Date: 2011-01-13 17:39:08 UTC
From: Dean
Topic: 880 Message: 880

I have just purchased the DVAP and have a few questions. I am running this on a MacBook Pro with OS X 10.6.6. I have installed the application and everything seem to work fine. I can link and unlink repeaters and carry on QSO's with no issue. On the DVAPTool I have entered my call sign and checked the lock box. I was thinking this would lock it out so it would not respond to any other DV signal but mine. I tested this and found out that another user could in fact link and unlink to repeaters as well as quarry it for information. We did not try having a QSO with it though. This is because as I understand it when it passes traffic out to the repeater or reflector it will use my call as it is entered in the DVAP Tool with the ext /DVAP as well. Am I doing something incorrect here or is this a bug in the OS X version.

My second question. I see by the DVAP instructions it says that I should put an "A" in the eight position on the call sign entry. Then add this entry in to my gateway registration on the same gateway that I have registered my call sign at. It was my understanding that A,B,C,D, and G was reserved for the sake of keeping a simple standard. For example if I say my call sign as KB5QJJ A. I would think this was a repeater on port A. It was suggested that I should us P for use with my HT or M for my mobile rig. Is this correct or am I totally confused? Also when I did add the P on my call in the gateway server and I waited 24 hours to ensure that it should have propagated out with no issue. I added this to the DVAPTool and when I would connect to repeaters some would work just fine but others would only allow my to connect for receive only. Again is this an issue on my side or a configuration issue on the repeater side.

Thanks
Dean

Hi Dean.

What callsigns are you using for the station field and in your radio? When the lock is checked, the code checks for a match up to the first space in both fields. It also ignores the eighth character used for the "terminal". Note that the code is the same for all platforms.

The DVAP docs do not say you "should put in an A". They just recommend it. While this field is used in gateway calls to indicate modules, it is meaningless in a users callsign so there is no problem using the eighth character.

882. Re: Configuration question on the call sign lock and "A" at the end of call sign

Yahoo group: DVAPDongle
Date: 2011-01-13 21:38:58 UTC
From: Dean
Topic: 880 Message: 882

For the lock part their was two different call signs. The call on my ht is KB5QJJ or KB5QJJ P. I've tried both. But even when it was locked the other radio with a different call could still query the DVAP as well as link and unlink to repeaters or reflectors. I'll test it again just to make sure I didn't have it unchecked when I thought it was checked.

The docs do say its recommended but the question I have on this mainly just a curiosity. Why "A"? The big question on this is why is it that on some repeaters I can only link receive only and others normally when I use the eight character. Take it out and everything works fine. Not sure if this is me or not.

Thanks
Dean

I have heard it explained that the A is kind of a courtesy to those that might find your call on a dstar internet dashboard.

If they see an A after your call, it lets them know that you are on a DVAP and that they cannot "Call Route" to your station.

Makes sense?

I added this to the DVAPTool and when I would connect to repeaters some would work just fine but others would only allow my to connect for receive only. Again is this an issue on my side or a configuration issue on the repeater side.

I have been running the Dongle on XP fine. I just got a new Lenovo W510 Laptop running Win 7 Pro. Went through all the install procedures with regular dvap tool and the 2.0 Beta 4. Tool can not see the dongle. Any ideas?

Hi. Sometimes we have seen Windows 7 fail to install all of the driver bits correctly. Try going to www.ftdichip.com and download the VCP driver and install it. That should make your device visible again.

886. Connection Dropping

Yahoo group: DVAPDongle
Date: 2011-02-01 21:57:09 UTC
From: Ian VK2HK
Topic: 886 Message: 886

I have a strange problem using my DVAP, when connected to a gateway or repeater, after I start to talk I can only do this for anything from 30 seconds to a minute before my conversation becomes garbled and drops out. I thought the problem may have been with the DVAP unit itself but when I do the same thing using Echo, I am able to talk for a full 3 minutes without any dropout and get the same conversation echoed back to me. I then looked at my internet connection, but all the tests I have done are telling me I have an upload speed of between 650 and 700kbps, I have tested this with many different upload tests as well as uploading data myself to other sites and checking speed, my upload speed does not vary much at all. Are there some settings I may be unaware of to fix this problem and or some other test that can be done to find out exactly what the problem is. Also just to let you know I have tried this on both an 80AD and 92AD and have tested this on all power levels and various distances from the DVAP depending on the power level used and as already stated the echo test works great every time.

Thanks

Ian (VK2HK)

G'day Ian,

A couple of things that come to mind...

What version of the DVAP Firmware are you running? Either way, the latest v1.05 has been proven to be stable by many down here in VK3. Some DVAP's may still be shipped with older versions. From my experience, v1.03 was a shocker but v1.05 has been fine all round.

Recent testing over the last six months has shown that any ports on REF003 can be wobbly at times compared to testing on REF023 ports.

That's about all I can offer - hopefully Robin or someone will be able to shed some more light on your issue.

I regularly run two DVAP's, they both run firmware v1.05 and they both co-habitate and function well.

Cheers,

From: dominichawken
Topic: 890 Message: 890

Installing DVAP Dongle software on a fresh CentOS Linux box, the software doesn't run for me. It gives an error -

./DVAPTool: symbol lookup error: lib/libQtGui.so.4: undefined symbol: FcFreeType

You have to run it from the command line to see the error - just double clicking the program icon gives nothing.

Anyway - in case anyone else has the same problems the solution is here:

http://joseph.freivald.com/linux/2010/06/09/qt-4-6-3-and-qt-creator-1-3-1-1-updates-for-centos-5-5/

turns out the fontconfig package isn't imstalled by default, so as per the link above type:

```
rpm -ivh http://software.freivald.com/centos/software.freivald.com-1.0.0-1.noarch.rpm
yum update fontconfig fontconfig-devel qt4 qt4-devel qt4-doc qt4-postgresql qt4-odbc
qt4-sqlite qt-creator
```

All good now - maybe needs adding to the FAQ.

Dominic - G6NQO

Hi David,

Run terminal, go to the path (as you say you already have it - for me it's:

cd ~/Desktop/DVAPTool/

because I expanded the DVAP tools to my desktop. In unix, '~' means 'home directory.

To run the prgram, it's not like Windows or DOS where you just type the filename, in unix you have to put a './' bfore it, so type:

./DVAPTool

and it should run and either launch, or show an error from which you can usually work out what the problem is.

Best,

Dominic.

895. Range tests?

Yahoo group: DVAPDongle
Date: 2011-02-07 04:43:06 UTC
From: iceberg iceberg
Topic: 895 Message: 895

I was wondering if anyone had done any range tests with the DVAP?

Im curious about the range I might get in a rural area using an IC-92AD. Are there any performance gains from using a non-stock antenna? I did search and read that even a low power RF amp to even as low as 2W is highly not recommended. The nearest D-Star repeater to me I can hit easily with the IC-880h in the car but the IC-92AD has some issues depending on where in town I am. If I get too far from the repeater which is on average 25 miles away I get some digital artifacting in voice transmissions. Until my local club is able to get a d-star repeater up I was hoping that the DVAP might be a valid solution but there are times where I may be 4-5 blocks from where the DVAP is connected (nearby friends and family some that have no internet).

I have a Diamond SHR999 antenna around that I thought might work well but wanted to get some input from existing users before I decided to go that route and invest in the DVAP.

Thanks
Bryan

Topic: 895 Message: 898

G'day Bryan,

With the DVAP sitting on the window ledge at a house with a 1/4 wave antenna, I get about 700metres of range in an urban environment. With the supplied antenna, it's about 400metres. With a modest base antenna at house roof height, a few kilometres is usually the range. In country areas it's more. You can also x-band repeat these things through a rig like an IC-2820H (in x-band mode and using N-FM) for a range of about 15kms, depending on your base antenna setup. The switching time of the IC-2820H is fast enough for all of the headers to go through. Just run the 2m side at 5watts and the 70cm side at 15w or 50w and it'll be fine.

But as you've been advised, running these things through any type of external PA is not reccommended as all sorts of junk will appear right across the 2metre band.

If I were you, try running the DVAP direct into a decent base antenna first and give that a go. You might be surprised.

Cheers,

Hi, Bryan,

There's lots of experience out here...

>I'm curious about the range I might get in a rural area using an IC-92AD.

That depends on the same thing any VHF/UHF range does - elevation of the antenna and obstructions, power and receive sensitivity. The power is fixed at 10 mW, and the receive sensitivity is OK (but selectivity is zilch). Only you know the elevation.

>Are there any performance gains from using a non-stock antenna?

Absolutely. The little micro-ducky supplied is for convenience, but provides only a few hundred feet range. Connect the DVAP to an external "base station" antenna on the roof - say 30 feet above ground, in level terrain with only other, similar houses around - and you can get a mile or more with a mobile. A little less with an HT. Of course, the elevation and antenna on the HT count, too. This is just radio.

>I did search and read that even a low power RF amp to even as low as 2W is
>highly not recommended.

The DVAP transmitter is "dirty" (Robin may want to pick a different word) - lots of noise across the band. At 10 mW, the problem is very local (it wipes out all the VHF channels on all the radios in my car when it keys up). You don't want to amplify it.

>The nearest D-Star repeater to me I can hit easily with the IC-880h in the
>car but the IC-92AD has some issues depending on where in town I am. If I
>get too far from the repeater which is on average 25 miles away I get some

That sounds about right.

>Until my local club is able to get a d-star repeater up I was hoping that
>the DVAP might be a valid solution but there are times where I may be 4-5
>blocks from where the DVAP is connected (nearby friends and family some
>that have no internet).
>
>I have a Diamond SHR999 antenna around that I thought might work well but

>route and invest in the DVAP.

The SHR999 is an extended HT antenna. That will improve the range from a few hundred feet to maybe 1000 feet, if the DVAP is just sitting on a shelf on the ground floor, but it won't give you the range you're looking for.

An external antenna on the roof, even a modest one, fed with good coax, will probably cover the 5 blocks to your HT.

An alternative is a "HotSpot" - this is a circuit board and software that connects between your computer and the "data" jack of an analog FM radio. The FM radio becomes the equivalent of the DVAP - it receives your D-STAR signal and passes the data along to the computer to be routed to D-STAR gateways via the Internet. It's not as "plug-and-play" as a DVAP (and I can't point you to a specific source to buy one), but it lets you use more power and a better receiver. If you've already got an FM base station - a relatively recent model with a 9600 data connector - it's an option.

Even if the DVAP doesn't make it to your friend's house, you'll probably find it useful around your house.

I use my DVAP at home connected to an outdoor antenna of 7db gain at twenty feet. I can use it for about ¼ mile with my IC80AD handheld, and up to one mile with my 880 mobile. I have communicated through it from over two miles away but I was stationary at the time and obviously in a great spot.

As some folks say here, you mileage may vary (YMMV)!

902. {Spam?} RE: [DVAPDongle] Range tests?

Yahoo group: DVAPDongle
Date: 2011-02-07 15:26:45 UTC
From: Fred van Kempen
Topic: 895 Message: 902

Bryan,

When I travel, I take my DVAP with me. Usually, the DVAP then runs with its stub,
and my IC92 uses another such stub. In my laptop bag (which is where the DVAP
normally "lives" ;-) I also keep an SRH999 and a somewhat souped-up "regular"
duck.. the SRH sometimes goes onto the DVAP, and the duck then goes onto the IC92.

Range is not spectacular, but I can usually walk around in the hotels and still be in
range.

I strongly recommend against using any kind of RF amp with this baby.. I tried, and
it works, but with hefty side effects. Dont forget: the chip used was not designed for
this "extended range" trick: its frontend is horrible, and its output stage filtering is even
worse, meaning, you'd be spewing several watts of junk into the air along with your
GMSK babbles :)

I can do about 100 to 250m with the above config, max, usually less.

(note: when in hotels, always request a room as high as possible in the building ;-)

Subject: [DVAPDongle] Range tests?

I was wondering if anyone had done any range tests with the DVAP?

Im curious about the range I might get in a rural area using an IC-92AD. Are there any performance gains from using a non-stock antenna? I did search and read that even a low power RF amp to even as low as 2W is highly not recommended. The nearest D-Star repeater to me I can hit easily with the IC-880h in the car but the IC-92AD has some issues depending on where in

town I am. If I get too far from the repeater which is on average 25 miles away I get some digital artifacting in voice transmissions. Until my local club is able to get a d-star repeater up I was hoping that the DVAP might be a valid solution but there are times where I may be 4-5 blocks from where the DVAP is connected (nearby friends and family some that have no internet).

I have a Diamond SHR999 antenna around that I thought might work well but wanted to get some input from existing users before I decided to go that route and invest in the DVAP.

Thanks
Bryan

Hello,

I use a dual band Diamond SRH77CA with my DVAP (mounted on the backside of my PC monitor) and have been able to get about 3-4 blocks away with an HT, that is with a moderate amount of foliage, etc.

I hope this helps.

Bryan

I can speak to the anecdotal performance of my system - can't get too much into the theory.

I'm using a 91AD with the DVAP. I've connected the DVAP to my Comet 2M/440 base antenna (might be the 333, forgot) on the roof using an SMA to SO-239 adapter.

Running the DVAP at 80% of full power and the HT on low power I'm able to carry on a good QSO from a mile away. If I'm walking it does it's R2D2 thing until I get to about 1/4 mile then it's solid.

Very little RF out here though so your mileage may vary.

Brain for what it is worth I too have tried to extend the range of the DVAP but without any active equipment. I have connected the output of the DVAP to a dual band twinlead J pole hung from our living room ceiling (15 ft height). With the IC92 in the car connected to a dual band "Hershey Kiss" type magnetic mount antenna on the roof of the car I have worked through the DVAP repeatedly to one mile in distance, E-W, N and S. I do not live in a treeless area. But here on Long Island (NY) most of the area around me on the south shore ,about 45 miles east of NYC, is flat and no high buildings. As expected the range of the DVAP in this configuration falls off very quickly after the mile. I am plese that 10 mw can cover the one mile distance. I am always able to re-establish communications by moving location about a one block closer to the DVAP from where I lose the DVAP signal.

I have spent some time looking at 5-7 watt SSPAs, filters, etc, and have found that listening to the advise of the DVAP developer to be the best path. Simply, the DVAP was not built to be a long range device.

Hi Brian,
Here are some details on how to extend the range of a DVAP without having to use a xband radio.

I get 1/4 mile in suburban Chicago with the mobile. It goes for a block and 1/2 with the HT. This it with a whip connnected to it inside the house. The outdoor DB224 at 8 feet brings that range out to a mile in the primary lobe and 6 tenths of a mile off of the back.

I can get about a mile with my outside antenna.
Not very useful as I am either home or more than a mile away.
I use the stubby ant, just tested the outdoor one out of curiosity .
The purpose of the DVAP is very short range.
Dale

910. Problems using DVAP this weekend.

Yahoo group: DVAPDongle
Date: 2011-02-07 21:17:20 UTC
From: Patrick Green
Topic: 910 Message: 910

Hi All,

I've had problems all weekend using the DVAP dongle. The voice responses were absent when I attempted linking up. When connecting to REF001C, I wouldn't get anything either but I would start hearing everyone if there was activity on the reflector. Here's the detailed output. It looks like I'm not getting to the gateway:

```
MacOS pgreen$ ./DVAPTool
DVAPTool version 1.02
Restored parameters:
UserCallsign=KA9SCF
DVDevice=/dev/cu.usbserial-A6007EZI
Frequency=145790000
SquelchLevel=-77
TxPowerLevel=10
O/S: MacOS X SnowLeopard
FTDI serial device cu.usbserial-A6007EZI found
Callsign set to KA9SCF
Frequency set to 145790000
new frequency (145790000)
Found 1 FTDI device(s)
Callsign set to (KA9SCF)
Opening DVAP device /dev/cu.usbserial-A6007EZI
Opened device /dev/cu.usbserial-A6007EZI

Hi Pat. We've seen this exact problem recently. I turned out to be the DSL/Cable modem/router. You might try to power cycle the modem to see if it makes a difference. In the recent case, it did not. They had to replace the modem and then it worked perfectly.

912. Re: Range tests? Use LMR240 LMR400 or LMR 600

Yahoo group: DVAPDongle
Date: 2011-02-07 23:01:24 UTC
From: ronchap@att.net
Topic: 895 Message: 912

Just a quick note. If you are trying to extend the range of the DVAP with an external antenna such as the Diamond DX50 vertical.
Since the DVAP only puts out 10mW. You're going to need to use very low loss cable with proper connectors attached. Do not use converters or adapters.

If you're only going to be running 20 feet or less of cable. LMR 240 will be just fine. If you're going to go out to 40 feet. You should use LMR 400. Out to 100 feet. use LMR 600.
I tried 9913 hard line and had to much loss. You need to use LMR cable.

I've done lots of range testing with many setups as maybe some of you all ready know from talking to me on 1C.

If you wish to talk about this further off site. Please feel free to Email me.

I couldn't agree more, as mentioned in my original reply to this thread, I use LMR-600UF (with N connectors). Even if only 6 or 7 mw make it to the antenna, the ERP is about 14mw's. My friend Nick - VE2HOT uses LDF4, which goes to a high gain stick on his tower and I've seen for myself how he gets pretty close to 5 miles!! Granted there's barely an S meter reading but it proves how with D-Star / digital that its good to the very end!!

With anything less that LMR-600 or LDF, the feedline drinks up whatever the DVAP puts out.

Just a quick note. If you are trying to extend the range of the DVAP with an external antenna such as the Diamond DX50 vertical.
Since the DVAP only puts out 10mW. You're going to need to use very low loss cable with proper connectors attached. Do not use converters or adapters.

If you're only going to be running 20 feet or less of cable. LMR 240 will be just fine. If you're going to go out to 40 feet. You should use LMR 400. Out to 100 feet. use LMR 600.

915. D-Star Forums at HamCation

Yahoo group: DVAPDongle
Date: 2011-02-08 14:57:02 UTC
From: kj4g
Topic: 915 Message: 915

For those going to Orlando this weekend for Hamcation, there will be a D-STAR Forum on Saturday from 1:45 to 3:15 pm. The Forum will be held in the Children's Safety Village, just 1500' east of the main entrance at 910 Fairvilla Road, in Classroom II. The Village is a short walk from the main buildings and has indoor rooms for a comfortable setting.

The topics to be presented are:
Radio Programming Ed Woodrick, WA4YIH
DV Dongle and DVAP Robin Cutshaw, AA4RC
D-RATS John Davis, WB4QDX
Airborne D-STAR Scott Hartlage, KF4PWI

Come join your fellow D-STAR enthusiasts at Hamcation.

926. Tips for a new DVAP owner

Yahoo group: DVAPDongle
Date: 2011-02-20 02:18:05 UTC
From: wmayfieldus
Topic: 926 Message: 926

All,

I am fairly new to DSTAR. There is a DSTAR repeater in our area but I like the possibilities available through the DVAP especially when traveling. So I ordered one yesterday and I should have it Tuesday.

Would like any tips you guys might offer. The primary question I have is what simplex channel seems to work the best. I know it depends on your are, but is there one or two that seem to have less interference in most areas?

Walt, you'll love your DVAP, I have two and plan to get more. I program two favourite reflectors right now and scan them both the the two frequencies I programmed in my radio - assigned to a bank. Anyway, when you get yours, download the Readme for DvapFMSetup, DvapUpdater, and DvapUtil its gives you a band scope which will let you see the noise on the band so that you can choose a quiet part of the simplex part. It works well. Also make sure to update the firmware to v1.05.

Agreed. This far down the calendar, I would expect them to be cheaper. Then again, they are hackable if you know Linux, and if you get Java on there (don't see why not) and it has the right USB goodness, it could be a nice little unit.

Has Bluetooth, too, so you could hack it for the Dongle!

I had the same problem, apparently there was a network issue with the D-Star primary name server, so the DVTool couldn't get the gateway list. It's back working now, and to reduce the likelihood of this happening again, Robin is going to release a new version of DVTool that will fail over to a secondary nameserver in the case that the primary is not available.

934. DVAP utility or application that allows point and click Reflector Linking

Yahoo group: DVAPDongle
Date: 2011-02-25 14:04:30 UTC
From: JF
Topic: 934 Message: 934

Hi All,

I was wondering if there was software out there that works with the DVAP that allows Reflector linking and unlinking through the PC/laptop interface?
As it is now, linking/unlinking is handled through the radio to the PC/laptop running the DVAP tools utility.

When in front of the computer, it would be nice to be able to just point and click to to linkup/unlink from various reflectors to make the process easier.

Thanks,

Jon

935. DVAP - Call routing

Yahoo group: DVAPDongle
Date: 2011-02-28 14:32:29 UTC
From: ipscone
Topic: 935 Message: 935

Guess I should ask this in this forum, instead of the dstar forum.

I'm getting a DVAP for mobile applications. I have a question concerning operation of one of these devices, with regards to DStar.

Can calls be routed to this device, if I'm moving from location to location, but continually connected to the internet? Normally, calls get routed through repeaters. So I'm not sure if this device acts more like a repeater or radio.

Example: say I have one of these mounted in my jeep, with computer and cell connection to the internet. And say I'm communicating with it, using my IC-92AD.

First Question: Can a call be routed to my IC-92AD, from someone in another part of the world, just like it could, if I were connected to a repeater?

Second Question: How are the callsigns handled? My radio has KC7VE in it for MY:. Is there a callsign in the DVAP? Same or different from my HT?

Thanks,
Mike
KC7VE

936. Does DVAP completely negate the need for DVDongle?

Yahoo group: DVAPDongle
Date: 2011-02-28 14:40:18 UTC
From: ipscone
Topic: 936 Message: 936

I think, in my case, the answer is no.

I have need of DVDongle, for a trip I'm taking to Japan. I will have a Japanese license (already applied for and on the way), but it won't cover DVAP, since that technically requires two radios (one on each end. The DVAP is a radio and I'll have to use a radio to communicate with it). It's so new, no one might care. And it's low power so no one might catch it. But I like to play legal.

But technically, in Japan, when you have something like this, and communicating with your own station, it requires 2 licenses, just as IRLP does.

So, the DVDongle will allow me to communicate over DStar, while in Japan. It requires no radios, and doesn't fall under the radio regulations. There are no D-STAR repeaters, in the area I'll be staying.

But, with regards to the topic, in general, does the DVAP negate the need for DVDongle?

Mike
KC7VE

937. Re: [DVAPDongle] DVAP - Call routing

Yahoo group: DVAPDongle

From: Donald Jacob
Topic: 935 Message: 937

Mike,
I think that it would be easier for you to have your DVAP connected to a reflector
and be called through the reflector.
The DVAP uses connection through Dplus, which does not do call routing.
So to answer your question, the DVAP (or DONGLE) will not respond to call sign
routing.
Please, someone correct me if I am wrong.

I have my DVAP software (the one from Dutch*Star) set to WB5EKU A.

Hope this helps

From: Tim Hardy AF1G
Topic: 936 Message: 939
Attachments: 2 described; binary payloads are missing from this source WARC

If you already own a D-Star handheld, then I would say, "Yes, the DVAP negates the need for a Dongle."

If you don't currently own a D-Star handheld and want to get into D-Star the least expensive way, then the DVDongle alone might be the way to go.

They both connect you to the "network," to D-Star reflectors and repeaters. One gives you a certain amount of mobility around your home or property, while the other requires you to be "rock bound" to your computer to monitor and talk, unless you use a Bluetooth headset/mic with your computer.

What does the customer (you) want? D-Star the least expensive way, using your computer mic and speakers (or headset/boom mic) or the mobility of the DVAP and a handheld at greater cost? Of course, you can also use a D-Star mobile with the DVAP instead of a handheld.

Tim, AF1G

I think, in my case, the answer is no.

I have need of DVDongle, for a trip I'm taking to Japan. I will have a Japanese license (already applied for and on the way), but it won't cover DVAP, since that technically requires two radios (one on each end. The DVAP is a radio and I'll have to use a radio to communicate with it). It's so new, no one might care. And it's low power so no one might catch it. But I like to play legal.

But technically, in Japan, when you have something like this, and communicating with your own station, it requires 2 licenses, just as IRLP does.

So, the DVDongle will allow me to communicate over DStar, while in Japan. It requires no radios, and doesn't fall under the radio regulations. There are no D-STAR repeaters, in the area I'll be staying.

But, with regards to the topic, in general, does the DVAP negate the need for DVDongle?

Another missed point.

I wasn't wondering which to buy or if I need to buy both. My question was just a question to see why others feel they NEED both.

I gave my reasons. I have a D-Star radio but NEED both. A DV Dongle doesn't require 2 licenses for use in Japan. A DVAP technically does, the same as IRLP, WIRES and other VoiP/Radio applications where a single operator communicates with his own node. So, I NEED both.

But like I said, I wasn't looking for a description of both, to decide which is right for me. I already have that information. I was merely inquiring why others feel they need both.

Topic: 935 Message: 941

Thanks, that makes sense. If I have a cell connection, why not just stay connected to a reflector. Anyone could see I'm online and just contact me that way.

The reason I asked is because I'm going to be going on a 5,000 mile round trip, road trip and I wanted to have the maximum connectivity. I will have RF, IRLP node, EchoLink and now D-Star connectivity for my entire trip.

Thanks,

Followup:

Ok, no routing. But if I'm on my HT talking through the DVAP, does that also mean I can't control the DVAP, from my HT? I mean can I use the HT to change what I'm linked to? Bring up links, unlink, etc? OR must everything be setup in the DVAP and I'm stuck with that setting until I change it from the PC application.

I guess I'll need to get the manual or read more about this. In any case, I'm getting one. It will arrive tomorrow.

Thanks for the reply.

From: Bob McCormick W1QA
Topic: 936 Message: 943

I would also think that if you're sitting in Japan (or anywhere) using the DV Dongle ... you can use whatever amateur radio license you like as there isn't an RF component really happening. (You'd have mic to PC to dongle to Internet to some part of the D-Star infrastructure and then the reverse would be back from the Internet through the dongle and out the computer audio device.)

I have both (the DVAP and DV Dongle) ... and when I'm traveling I think its easier sometimes to just use the DV Dongle and the mic/speaker with the notebook. But I've also used the DVAP - but as you've pointed out ... that's two RF devices and there may be some licensing issues you'd need to consider.

Lastly - as already pointed out ... just connect to a reflector (versus repeater) and let the dplus stuff take care of it all (don't worry or bother with the native ICOM callsign routing).

Short answer is that the DVAP and DVDongle do not support call sign routing.

Even if they did, odds are that your mobile connection wouldn't allow inbound connections. Most operators NAT their addresses, breaking inbound access.

DVAPs and DVDongles connect to either repeaters or reflectors. If people want to find you, just let them know what repeater or reflector that you are going to connect to. This can be seen by looking at the last heard list at www.dstarusers.org<http://www.dstarusers.org>. Or by watching the status page on repeaters or the status page on the reflectors (can be found from the reflectors page on www.DSTARInfo.com<http://www.DSTARInfo.com>).

Most people use the same callsign through their DVAP as they do through normal repeaters.

Subject: [DVAPDongle] DVAP - Call routing

Guess I should ask this in this forum, instead of the dstar forum.

I'm getting a DVAP for mobile applications. I have a question concerning operation of one of these devices, with regards to DStar.

Can calls be routed to this device, if I'm moving from location to location, but continually connected to the internet? Normally, calls get routed through repeaters. So I'm not sure if this device acts more like a repeater or radio.

Example: say I have one of these mounted in my jeep, with computer and cell connection to the internet. And say I'm communicating with it, using my IC-92AD.

First Question: Can a call be routed to my IC-92AD, from someone in another part of the world, just like it could, if I were connected to a repeater?

Second Question: How are the callsigns handled? My radio has KC7VE in it for MY:. Is there a callsign in the DVAP? Same or different from my HT?

Thanks,
Mike

Mike
You can change channels, link, unlink etc from HT as long as you are within range of the DVAP antenna. . The DVAP is just a dumb terminal so to speak.

I have 4 bicycles, but only one sportcoat!

We all have reasons for owning whatever we have, maybe someone gave us something, maybe we like the color of one?

If I ran any "nets" on dstar I would for sure use the Dongle as the software interface supplies you with lots of information as to who is checking in etc.

They both get you on dstar, but using a different interface.

From: Tim Hardy AF1G
Topic: 935 Message: 947

You can control how the DVAP links and unlinks to reflectors or repeaters just like you would control your local repeater with a handheld or mobile radio.

I programmed one bank in my HT and mobile radio for DVAP use only. Channel 00 is my "home channel" where I talk. Channel 01 is programmed with the unlink command, chan 02 is the "I" command, chan 3 is the "E" command, and chans up from there are programmed with link commands for all the reflectors and repeaters I may want to use. After I quick-key on a repeater or reflector channel to establish the link, I punch "00" on the keypad to return to the home channel to talk. When done, I turn the knob one channel up and quick-key to unlink.

The DVAP operates just like a repeater with a Gateway except that it doesn't repeat signals locally and doesn't do callsign routing.

Sorry to have disappointed.

I had a DVDongle shortly after they came out and was not satisfied with it and sold it. I should note that the Dongle software has improved a lot since then and I might like it now but haven't re-tried it. When the DVAP came out, I bought it and an IC80AD to use when my extended family took our annual summer vacation to a Gulf coast seaside town. I wanted to "keep in touch" and the DVAP seemed the best way to do it. I also was wanting to break into D-Star. There is no Ham repeater within range of where we vacation. I used the free Wi-Fi hotspot at the Marina for Internet access and was pleasantly surprised at the ease of communications. I could also have used EchoLink on my laptop to keep in touch through FM repeaters/nodes, which would have been similar to linking to D-Star nodes with a DVDongle.

I have also used the DVAP with a laptop and aircard while mobile, and most recently with a Mi-Fi cellular hotspot device from Verizon. While there are occasional signal drops in the cellular system while driving through one system after another, it has worked very well for mobile D-Star use. While operating like this, my handheld becomes nothing more than a wireless mic when talking to the DVAP.

Since I have the DVAP, I do not see the need for a DVDongle. I hope this answers your question.

949. RE: [DVAPDongle] DVAP - Call routing

Yahoo group: DVAPDongle
Date: 2011-03-01 16:11:26 UTC
From: Fred van Kempen
Topic: 935 Message: 949

A DVAP is a combination of a tiny little transceiver with what is now known as a 'hotspot board' or 'GMSK modem board' in a small package.

Coupled with the right software on the PC (or Mac), this device can be seen as a lil' personal repeater, yes. This in turn means: you ALWAYS need a "D-STAR radio" to communicate *through* it: a DVAP does not know anything about audio frames, AMBE chips and so on. Its just a (digital) repeater.

Depending on the software used on the host, you will be able to connect to and communicate through a DPlus-based network (reflectors and many gateways and/or hotspots), a DExtra-based network (x-reflector systems) and, in some cases, even operate as true G2 repeaters (using callsign routing) - this depends entirely on the host software, not on the device.

So... when used 'on the road', it can connect to many, but: you will still need to bring your D-STAR mobile radio or HT (erm... and try not to forget its charger *cough* !)

If you don't wanna bring the radio, you can still connect, but that would indeed require a DVDOngle-ish device, which can use "a" source of analog audio (pc mic, etc) and, through its software, connect to the D-STAR network of choice. This is somewhat less convienient (as you'd have to sit in front of da peecee to talk) but it also frees you from having to bring
a radio with you.

Cheers,

Fred

Subject: [DVAPDongle] DVAP - Call routing

Guess I should ask this in this forum, instead of the dstar forum.

I'm getting a DVAP for mobile applications. I have a question concerning operation of one of these devices, with regards to DStar.

Can calls be routed to this device, if I'm moving from location to location, but continually connected to the internet? Normally, calls get routed through repeaters. So I'm not sure if this device acts more like a repeater or radio.

Example: say I have one of these mounted in my jeep, with computer and cell connection to the internet. And say I'm communicating with it, using my IC-92AD.

First Question: Can a call be routed to my IC-92AD, from someone in another part of the world, just like it could, if I were connected to a repeater?

Second Question: How are the callsigns handled? My radio has KC7VE in it for MY:. Is there a callsign in the DVAP? Same or different from my HT?

Thanks,
Mike

Phil,

> A short answer, No. DVAP's & Dongles aren't "routable". Sorry.
That answer is a bit misleading.

DVAPs and Dongles are devices, and each does its stuff. What it can or cannot do depends *mostly* on the host (support) software, and in this case, that is the part which determines whether or not one could use a DVAP with callsign routing. I can, for example.

Obviously, since the original poster intends to use it in Japan, he does have a choice: he can leave the DVAP in his hotel room (or wherever he is staying) and connect it to his favorite gateway or reflector, and then keep his HT with him to babble through- same for using a Dongle.

Using the HT "from" the Japanese network pretty much requires full callsign routing, and this doesn't always work between the Japanese and non-Japanese networks, depending on the state of the synchronization between the networks.

To play it safe, I'd bring both, "assume" I have to use the DVAP as described above, but then still try to use callsign routing, even if for the experience alone...

I use "inbound" calls all the time with mobile IRLP. But I understand that it's not possible for other reasons.

That's exactly why unsaid I NEED both. BTW there may well be RF on the other end, so I can see the need for at least one license. But the DVAP requires 2 in Japan, technically, if you are talking to your own station. Japan'sregulations are different from the US.

Just curious, how can the person use a DVAP in Japan if it's not legal to connect outside of Japan for Japanese users? It's still RF on the last hop. Shouldn't this user be using a DV Dongle then?

Hi, Mike,

The DVAP and DVDongle both get you on D-STAR gateways and repeaters using your computer and the Internet, but they do it in very different ways, and have different capabilities. If you want the full set of capabilities, you need both devices. Your situation in Japan is pretty unique. Here's what I see from a more generic perspective:

DVAP
The DVAP lets you roam about the house with an HT and access the D-STAR network. You use the HT to command the DVAP to link and unlink, just as you would a repeater.

The computer display of the DVAP doesn't tell you much. You can see the repeater or reflector you're connected to, and the call sign of stations being received. You are connected to just one port of the repeater or reflector, so you don't hear traffic from the other ports. Using the computer interface, you can record the activity the DVAP monitors into an audio file, but the DVAP is intended to be operated away from the computer for the most part.

DVDONGLE
The DVDongle uses your computer audio system for "transmit" and "receive." There's no RF involved on your end, and you have to be physically at the computer. But the computer display gives you some interesting information that the DVAP (and over-the-air repeaters) don't:

You see the "bit error rate" on received signals. Not really an S-Meter, but it reveals a lot about the quality of the received signal.

If you're connected to a repeater stack, you get a list of reflectors or other repeaters that system is connected to. You can monitor all three repeaters, if the stack has all three. You see a list of recent stations using the system, and any other DVAPS or DVDongles are connected. And you generate a "history" list of stations you've "received".

If you're connected to a reflector, you can see a list of all the repeaters connected to all the ports of the reflector, and all the DVAPS and DVDongles connected. You can monitor all three ports. And you generate that history list.

I may have missed a feature or two, but I think I got most of it.

At hamfest forums, Robin (the developer of both devices) got questions about a device that did both functions. He said there is one, and it costs $452:

$200 - DVDongle
$250 - DVAP
$ 2 - roll of duct tape to tape the two together.

And you need two USB ports. But yes, a single PC can run both at once, with no conflict.

From: J. Moen
Topic: 955 Message: 955

The short answer is no, the DVAP does not completely negate the need for a DV Dongle.

The first reply, by Tim AF1G, was by far the best reply. If you already have a D-Star radio, DVAP is probably the way to go since it provides mobility around the QTH when at home, or around the hotel when travelling. If you don't have a D-Star radio (e.g. HT) already and you are concerned about cost, then the Dongle is a good way to go. You can get on the D-Star network for US $200 with a Dongle, and there's no cheaper way to do that. The example of licensing issues in places like Japan is another reason to have a Dongle.

By the way, the Dongle has other uses. For example, let's say you have a DVAP but would like to convert your analog radio to D-Star. You've heard about the new IC-9100 with D-Star option that can do D-Star on 6 and 10 meters, and you want to have a QSO with them. Get a DV Dongle and software from Jonathan G4KLX from the Files section of the "dstar_development" Yahoo Group. You can get DStarClient and use a soundcard interface (this is somewhat tricky), or you can get a gmsk node adapter (read about them on the "gmsk_dv_node" Yahoo Group) and use Jonathan's GMSKClient software. Both DStarClient and GMSKClient need access to the DVDongle for managing digital voice encoding/decoding. You'll have virtually any analog radio doing D-Star as long as it has a 9600 baud Data port on it, which most modern transceivers do.

(Note: there are more expensive ways to adapt an analog radio to D-Star, the commercial version not requiring a pc, but the software with Dongle approach will get you on the air. Be the first in your area to have a DX QSO using D-Star on 10 meters....)

When I went to the NASA high-reliability soldering course, I saw photos of bipolar junctions, before and after a static zap, taken using a scanning electron microscope. It's amazing what a difference one zap makes, even on a circuit that continues to function after the zap.

So, yeah. you probably damaged it. Apparently, you didn't kill it and it's very likely that it'll still outlast you. It's only really, really important in life-and-death applications or in spacecraft.

FWIW, I killed my cordless phone with a static zap a few weeks ago.

Michael,

I don’t believe there are many amplifiers that will support the 10mW input signal. Also, the signal can be a little dirty if you amplify it, so if you do, you probably need to add some good filtering to keep the spurs within the limits of your regulatory agency.

There are a number of people who have connected it to base station type antennas and are getting better coverage.

G'day Michael,

Attaching an afterburner to the DVAP is not reccommended - all of the little spurs across the band will be amplified as well. There's little front-end filtering on the DVAP's.

The way I and others occasionally increase the range, is by x-banding the DVAP up onto 70cm via a suitable x-band repeat rig like the IC-2820H. Run the 2m side at low power, the 70cm onto mid power, select the appropriate simplex freqs in each band, with 2m on the left and 70cm on the right, using N-FM as the mode, put the rig into x-band mode and off you go.

Cheers,

Not recommended at all. The DVAP does not have the additional filtering and suppression that one would find in a full-size transceiver, and boosting the DVAP signal will result in harmful interference.

Hi

It can be done using a normal PA-module. But keep in mind the DVAP is not suitable to connect to an external antenna due to the lack of AGC so it will be easily overloaded by strong RF fields

There are a couple of things one of the guys at my club has tried:
- the supplied antenna is not resonant on 2m, and has practically infinite VSWR (it seems to resonate somewhere around ~400MHz). If you put a proper resonant antenna system on it, you might increase the range to about a kilometre.
- build a power amplifier. The guy I know built an amplifier that takes the output up to around 5W, which matches a handheld nicely.

You would all be surprised what you can accomplish with 10mw. I have my DAVP connected to a ½ wave antenna in my attick via 50’ of LMR-600UF and I get up to 2 miles with it. It amazes me every single day. Its not a clean TX radio, put and amp on that thing and you’ll have spurs everywhere!!!

There are a couple of things one of the guys at my club has tried:

- the supplied antenna is not resonant on 2m, and has practically infinite VSWR (it seems to resonate somewhere around ~400MHz). If you put a proper resonant antenna system on it, you might increase the range to about a kilometre.

- build a power amplifier. The guy I know built an amplifier that takes the output up to around 5W, which matches a handheld nicely.

Hi Group,

The supplied antenna with the Dvap is nothing more than a “Dummy Load” get an adapter and put a proper antenna on it and you will get far greater coverage.

Regards

David G6OCD.

970. Duration that a DVAP stays linked to a Reflector

Yahoo group: DVAPDongle
Date: 2011-03-09 11:51:11 UTC
From: Nik Presser
Topic: 970 Message: 970

G'day Robin and all on the list,

I've got two DVAP's running v1.05 and they've been excellent. I get a lot of use out of them. They're quite popular here in Australia and most of them have come from Mark at HRO Atlanta with a delivery time generally 6 to 7 days. Great service!

In regards to the duration that a DVAP stays linked to a Reflector, unless locally forced, when the DVAP unlinks itself is this usually dictated by the Reflector or is it because of an excessive amount of missed Keepalive flags?

My link-up duration varies from 1 day to nearly a week on occasions. This is not a showstopper or major issue. I'm just interested in what may be limiting its up-time on occasions, mainly from an awareness perspective. I thought I saw a similar question on the list a while ago but of course I'm unable to locate any commentary on it.

My main DVAP shares a PC with a HotSpot (using a Satoshi Node Adapter) residing in the garage, with the rack (including an IRLP node with its own PC) and DSL modem all protected by a 3kVA UPS.

Have you any more new toys in the pipeline, Robin?? :-)

Keep up the good work!!

Hey Nik,

I have the very same setup here in New York and also have the very same expiriences. As I've been saying here and elsewhere, if only the DVAP would reconect like the DVAR software will automatically when the connection is lost, it would be better than perfect. By the way, I get up to 2 miles with my DVAP which is connected to my tri-plexer via a male SMA to Male "N" adapter, then to a 50' run of LMR-600UF which goes to a Austin Suberban tri-band (2meter/220/440mhz) antenna only 20' above the ground.

I'd love to try one at a mountain top with a GOOD antenna and see what 10mw can do line of sight!

Hi Nik. What most of us don't realize is that a DSL or cable internet connection is not 100%. They have routing outages all the time without most of us noticing. It is only when you run an app that stays connected for a long period of time and disconnects when keepalives are not consistent (like DVAPTool and DVTool), that you notice the outage.

I've already put auto reconnect logic into the next release of both DVTool and DVAPTool so watch for new release announcements on these email reflectors.

I wonder what happens more often, the local connection dying or the reflector you are connected to reboots or restarts? Just in the short time I've been using this system, I've been disconnected from the reflector more often than the local DSL/Cable going down.

Hi Pat. It's probably not as much your DSL/cable going down as it is interruption in service. My service rarely goes completely down but I do see periods of routing problems when I monitor it 24/7.

Pat (and group - of course)

Our internet is far from robust. There is a lot of "patchwork" in it that is part of the latency and packet loss that's inherent in it. In the commercial recording world everyone is wondering how much longer can we assume having ISDN BRI (Bit Rate Interface) lines. It's a technology that phone companies around the world don't really care to maintain anymore since it's considered an archaic technology. So several companies have been coming out with what they call The Solution, which is software / internet based programs for connecting studios. Well, they're all worthless. The amount of errors that occur in a session because of connection problems don't make it a viable choice. It comes to the same thing, our internet is too slow and riddled with hiccups and breaks and we have no choice but to accept it for now. Technology has certainly outpaced the infrastructure we depend on to exploit what's available.

Donald,

Interesting. I'm surprised the people doing "The Solution" (which I take to be a new networking commercial audio software application) do not pack in tons of redundancy (or should I say redundundancy) and FEC. It is possible to have an audio stream survive all kinds of temporary slowdowns and interrruptions if you are willing to take the effort and use the bandwidth. For networks capable of handling video streaming, some beefed up audio streams should easy to handle. And if you don't have to worry about standards -- the same app on both ends of the connection with the internet used only for transport -- it should be easy to implement.

My son in Germany has ISDN phone service and really likes the extra features, but I suspect with SIP phones etc, cheap ISDN consumer phone service there will go away also. My son called my landline the other day from Germany using Google Voice. It was a free call. I guess they are folding in the Gizmo stuff they got when they bought that company. I have to say, though, I could tell it was over the internet. GV would not make it in the commercial audio world, that's for sure.

I wonder what happens more often, the local connection dying or the reflector you are connected to reboots or restarts? Just in the short time I've been using this system, I've been disconnected from the reflector more often than the local DSL/Cable going down.

On Wed, Mar 9, 2011 at 8:07 AM, aa4rc <aa4rc@...> wrote:

Hi Nik. What most of us don't realize is that a DSL or cable internet connection is not 100%. They have routing outages all the time without most of us noticing. It is only when you run an app that stays connected for a long period of time and disconnects when keepalives are not consistent (like DVAPTool and DVTool), that you notice the outage.

I've already put auto reconnect logic into the next release of both DVTool and DVAPTool so watch for new release announcements on these email reflectors.

I tried that once. Really no way to make it work. Doesn’t do well with Vonage or anything else that requires consistent bandwidth either. Sorry.

Hello,

Just replying to my own post..... Since I posted this yesterday I've done a bit of checking. Internet use seems to have gone through the roof since the earthquake and no doubt some circuits are out of use. So my problems might all be down to this. Things seem to be normal this morning but I no longer get the message that I am running the latest software when I start DVAP Tool.

From: ekaul_2000
Topic: 984 Message: 984

Hi

I'm new to DSTAR and DVAP. I registered for D-Star network access, but when using the DVAPTool it shows me as Receive Only.

My Callsign is KD0CZJ and I added an "A" in the 8th position as described. I have no idea what the "A" stands for or why it is recommended. I can connect to a reflector and listen in.

Is there anything more I need to do to allow transmitting too.

Thanks,
Eckhard, KD0CZJ

Hi Eckhard. I see your registration but no terminal has been added to the registration. Until you do, you won't be able to transmit. Check out the registration instructions at http://www.dstargateway.org.

While you are adding the terminal, you might add both a space " " entry and an "A" entry.

I've seen GPS data pass thru from my IC80AD GPS Mic via my DVAP on REF001 seems to be a combination of the DPlus software and enabling GPS data on the radio? But I have been able to click thru on the REF001 status page and have my GPS information displayed. It doesn't work with all reflectors or repeaters...but does spark an interest.

GPS data does pass through end to end. The issue is getting the GPS spot through to the APRS network. There is a program that runs on each gateway that watches the inbound RF packets and forwards GPS data on to APRS. Since the DVAP is not talking RF to a repeater, that program is bypassed.

I think the general consensus is that it is an excellent product -- I don't recall seeing any negative reports (most problems seem to be with user setup on the D-Star network, not issues with the DVAP itself, and Robin is always very responsive to users who experience difficulties). I am certainly very happy with mine.

Some "issues" I am aware of:
- I had no problems at all to make the DVAP work on my Mac and Ubuntu Linux systems
- For MS-Windows, I was getting "blue screens of death" during the software install. This was resolved by going to the FTDI driver website, getting the latest driver, and CAREFULLY following the FTDI install instructions (ie. disabling the Internet connection at the appropriate time). Then everything worked perfectly. I wouldn't have bothered with Windows at all, except that it was necessary in order to update the firmware on the device.
- Related to the above point, some DVAPs ship with old firmware, and in such cases it is recommended to update to the latest firmware using the Windows firmware updating program on the DVAP website (it's just a simple point-and-click process)
- If the DVAP loses IP connectivity to the D-Star gateway, then at the moment, the DVAP won't automatically re-connect -- I understand this is to be treated in a coming release of the DVAPTool.
- DPRS doesn't work via DVAP. In fact, this is not so much a DVAP issue (it does pass the DPRS data through to the network) as much as a D-STAR/DPLUS architectural one (where should it be treated in the network?). I understand that there is an intention to address this issue, but I haven't seen a specific proposal so far (eg. maybe DVAPTool could detect the DPRS data, and translate/inject it into the IS-APRS network).

There could also be other enhancements (eg. I would find it useful to be able to also link the DVAP using DVAPTool GUI, similar to DVDongle DVTool linking procedures), but in my view even today this is a great product that represents real value for money.

73,
MAtt VK2ACL.

Robin Cutshaw AA4RC, the software developer for the DVAP and DVDongle, monitors this list and frequently responds to questions.

I'm very satisfied with the two that I own. They do the job they were designed for - provide a limited pool of RF coverage allowing a D-STAR handheld to access the D-STAR network via an Internet connected computer.

As mentioned, getting the correct drivers accounts for 90% of the trouble users have had.

Some things I'd point out:

- they can be overloaded by a strong signal. I have some trouble with one I use on a netbook PC in the car. If I try talking through it with my mobile radio on 5 watts, it works for a few minutes, but eventually I get reports of a garbled signal when transmitting. If I use my HT, it works fine. Removing the antenna from the DVAP helps, but not completely. I need to spend some more time analyzing this issue to get a better handle on it. Of course, most of the time when it happens, I'm driving and can't do any troubleshooting.

- I'm looking forward to "automatic relinking." It's usually not a problem when connected to reflectors, but my local repeater has frequent, brief Internet interruptions, and the devices disconnect.

- You can add an external antenna for greater range.

1003. Need Adding DVAP Registration Info

Yahoo group: DVAPDongle
Date: 2011-03-31 00:26:47 UTC
From: JPinches
Topic: 1003 Message: 1003

Hi,

I have a 91AD which is already registered for RF and everything works fine. Also, I understand that it is not necessary to add the DVAP on the Registration Page; but is recommended for the Call Sign Routing alert for other stations to see. By adding the 2nd device DVAP, when I am on direct RF I can be reached via Call Sign Routing and when at home TX over DVAP, the alert indicator is there for others to see.

The confusion I have is how to add the DVAP in the DSTAR Registration Page denoting the "A" indicator. If there is one area that could make DSTAR easier for users, it would be adding clear non-techy instructions to use the registration page.

Currently my Registration Terminal Page looks like this;

Line 1.) KJ6MOX /(No Initial Box at all)/(No RPT Box at all)/IP NUMBER/kj6mox-91ad

The Next Line is Blank and looks like this;

Line 2.) KJ6MOX / Initial Box and Blank / RPT box and Blank / IP Number / (blank PC NAME field)

Now when I check Line #2 and try to add KJ6MOX A, I get errors after adding a space in the Initial Box (like I did setting up #1) and/or adding my call sign appended with the (SPACE A) in the PC Name field.

How exactly does one go about adding the DVAP to the Registration Page?

1004. DVAP Dongle to repeater to gateway caller

Yahoo group: DVAPDongle
Date: 2011-03-31 00:55:25 UTC
From: n2csa
Topic: 1004 Message: 1004

If this is answered someplace, please refer me to the message.

I use my DVAP to access a repeater in another part of the state. I seem to be able to converse with those accessing the repeater via RF but those accessing the repeater via the gateway via radio through another repeater don't seem to hear me. I hear them but they don't hear me. The DVAP terminal screen shows that their R modules are reversed, i.e. R1 is G and R2 is B. Hopefully I have explained the issue. Thanks for any help.

Topic: 1003 Message: 1005

Don't put the "A with your call. You put the "A" in the initial box.

Also make sure that you have the "A" in the 8th position of your MYCALL in the 91AD as well as the 8th position of the call sign field in the DVAP setup

I would like to comment on this, and up front would like to emphasize that I do not mean any disrespect to the original poster.

The statement about "[making] DSTAR easier for users" might be true, but is not necessarily a desirable thing. The ultimately easy DSTAR device would be something that looks remarkably like a cell phone, and you could even call it a cell phone. You would probably need to charge a monthly fee to someone to maintain the network and to lobby for licenses for spectrum and everything else. The people who work for such an enterprise would be professional DSTAR experts, and not "amateur" DSTAR experts.

We would probably have to pay for Yahoo forums to discuss DSTAR technical issues, also called "tech support" because we have to feed our families too, and we can't just give away information, you know.

I would suggest another option. Maybe the folks who are making DSTAR even better and better should keep doing that, even if it means that the rest of us need to study a little more or at least learn a little more in order to use this wonderful technology. It doesn't really need to be "so simple a cave man can use it."

One time there was a need for ham radio that was simple enough for a cave man. This is how CB radio was born. And "easy computers" is how Windows[tm] was born. All seven versions of it.

I am only suggesting that "easy" should not be a requirement for a new technology in use for amateur radio.

Another option might be that if someone wants to learn a new technology well, that he or she write a beginners user manual for it, thereby learning the subject at the same time, making it available for other newcomers. This would add to the base of knowledge on the subject instead of merely consuming it.

All the best, and 73,
Dave

This is a good idea. I've given presentations on subject matter I was clueless in just to learn it.

DVAPs are not registered. It is the radios that are using the DVAP that get registered. The reason that Robin recommends that you use a second registration for a radio that is connected to a DVAP is because IT DOES NOT SUPPORT CALLSIGN ROUTING.

Subject: [DVAPDongle] Need Adding DVAP Registration Info

Hi,

I have a 91AD which is already registered for RF and everything works fine. Also, I understand that it is not necessary to add the DVAP on the Registration Page; but is recommended for the Call Sign Routing alert for other stations to see. By adding the 2nd device DVAP, when I am on direct RF I can be reached via Call Sign Routing and when at home TX over DVAP, the alert indicator is there for others to see.

The confusion I have is how to add the DVAP in the DSTAR Registration Page denoting the "A" indicator. If there is one area that could make DSTAR easier for users, it would be adding clear non-techy instructions to use the registration page.

Currently my Registration Terminal Page looks like this;

Line 1.) KJ6MOX /(No Initial Box at all)/(No RPT Box at all)/IP NUMBER/kj6mox-91ad

The Next Line is Blank and looks like this;

Line 2.) KJ6MOX / Initial Box and Blank / RPT box and Blank / IP Number / (blank PC NAME field)

Now when I check Line #2 and try to add KJ6MOX A, I get errors after adding a space in the Initial Box (like I did setting up #1) and/or adding my call sign appended with the (SPACE A) in the PC Name field.

How exactly does one go about adding the DVAP to the Registration Page?

Hi Allan. It looks like you have only registered a terminal "P". This means your "mycall" will always have to have a "P" in the eighth character to work properly. You probably want to create a "space" terminal as outlined at http://www.dstargateway.org.

I am a little confused, I am about to take delivery of a DVAP, I have been using D-Star for over a year with my own and my clubs call signs, but I cannot ever remember going through this registration process. I did register through my local repeater website, but not

http://www.dstargateway.org.

Do I have to register there to use a DVAP?

Derek, you only need to register through your local repeater -- and I see you are already registered at GB7NB. So, you do not need to, and if fact must not, register anywhere else.

I notice you have only registered you callsign with a space. That is ok, if that is what you configure in the MYCALL fields in both the DVAPTool software and in your radio. However, if you follow the DVAP installation recommendations to use your callsign with the letter "A" at the end, then you will need to go back to GB7NB, log in and create a second terminal entry for that. However, lots of people ignore that recommendation, and just use spaces after their callsigns, and this is fine too.

Cheers,
Matt VK2ACL.

Hi Don. I checked the logs and I don't see any issues. I just connected to REF030 without a problem.

When you click "Open" in DVAPTool, the program fetches the list of gateways/reflectors from the name server. If your internet was intermittent at that time, you would not get the list. When you see this, try hitting "Close" and then "Open" again.

I just checked the logs on REF001 and I see quite a number of logins from you today. I also see where you keyed up several times. You switched back and forth between "VE3HOL C" and "VE3HOL " for callsign. The "C" version is not registered so you wouldn't be able to transmit using that.

Don,

The listing of reflectors on the DSTARUsers site is just a listing, and it’s an incomplete listing. (for better listing check www.DSTARInfo.com<http://www.DSTARInfo.com>).

The problem you are experiencing sounds as if it is an indication that the DVAP software does not have a list of current stations. It loads this upon startup. So you might want to restart the DVAP software.

If there is filtering between you and the DVAP site, then it is very possible that the request for stations is getting blocked. I know that if I’m connected to my companies network, they block specific ports and the DVAP software will not work. So if I disconnect and restart the software it becomes happy.

In my opinion, the DVAP software wasn’t designed to run 24x7. While it will happily run 24x7, it will not update its database, only when it is restarted is it reloaded.

G'day Don,

Have you tried any of the ports on REF003 and REF023 at all?

The REF003 box is based in Sydney Australia and REF023 is based in Adelaide Australia.

Some VK repeater gateways like VK3RWN deny any connections from DV-D's (except from the gateway admin), DVAP's and HotSpot's but accept other Icom gateway link requests (with very short time limitations). But, that's life...

Anyway, REF003-C is the most popular one in Australia... http://ref003.dstargateway.org/

Cheers,

Nik Presser

It is strongly recommended by the designer of the DVAP that you not attempt to attach any sort of RF amplifier to it. The DVAP does not have the filter circuits of a modern higher power transceiver and is very likely to generate all sorts of harmful interference if amplified.

If you want a higher power hotspot, one of the several available hotspot boards coupled with a good amateur transceiver will give you miles of range.

Subject: [DVAPDongle] Dvap output power Help

Does anyone know of any amplifers or some way to hook in line to give me more output from the dvap. I have been looking for at least a way to get 1 watt or 5 watts at most. Any help would be great. Please let me know of any ideas. 10mw just doesnt cut it for distance. Like i said if there is a way i can get at least 1 watt somehow it would be great. I have not been able to find any amplifers for a 10mw drive to 1-5 watts out. please help

Another way to do it to cross-band the 2m DVAP up onto 70cm via a capable cross-band repeat rig like an IC-2820H for example. Run the 2m side on low power and crank out the 70cm side on mid or high power - plus you get the added bonus of a better receiver. Run both sides of the rig on FM narrow. Works like a treat.

I like the cross band idea. I was already set up for it and did not know it.
Now I can use mine any were in the valley.
Don't need to tho as we have two D star repeaters to use.
Don't see any real need for a range further than the DVAP was designed for anyway.

1029. Connection Problems

Yahoo group: DVAPDongle
Date: 2011-04-16 22:32:35 UTC
From: kf7jzr
Topic: 1029 Message: 1029

I Installed the dvapdongle program but it does not seem to connect to anything.

The "connected to:" is not highlighted and the window is empty. My HT keys up and shows cqcqcq my call sign /C DVAP "not linked".

The instructions tell me that after I open the DVAP device window that the DVAPTool then makes a request to an Internet based D-STAR gateway name server. If DVAPTool has problems connecting to the server, a message box will pop up letting you know that there was a problem. Check your Internet connection and try again.

I never see a message or get anything that says its trying to connect.

Darrin,

The DVAP will not link automatically. You need to send a link command to it from your radio.

You will need to connect to a reflector, this you do from the HT not
from the software. The DVAP hooks up to the internet, but then you have
to tell it what you want it to do.

Take a look here :
http://www.dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP.html
Explains it far more eloquently than I.

You should be good to go then

Derek

I don’t think that anyone said that the FTM-350R would work. It probably links the audio from the receiver to the transmitter and that’s not enough for data.

Hi Tim. I went by HRO and tested with several of their radios that would crossband. Only the 2820 would work. Interestingly, most would crossband the dstar GMSK signal in one direction but would fail in the other.

G'day Brian,

No - the IC-2820H does not need the optional UT-123 to perform cross-band duties as described below.

Cheers,

Run the 2m side on low power and crank out the 70cm side on mid or high power - plus you get the added bonus of a better receiver. Run both sides of the rig on FM narrow. Works like a treat.

1041. Royal Wedding QSL Cards

Yahoo group: DVAPDongle
Date: 2011-04-20 17:43:12 UTC
From: David
Topic: 1041 Message: 1041

Hi All Sent on behalf of Martin G0VXC

Info for you about the r prefix for the Royal Wedding if you work other r stations I don't mind if you send direct to me

QSL arrangements for Royal Wedding Prefix

As the Royal Wedding prefix GR, MR and 2R replaces the traditional regional locator for G, M and 2 callsigns, it has been necessary for the QSL bureau to create a temporary special sub group to handle the expected large influx of cards. Martin Coles, G0VXC has kindly accepted the challenge of handling GR, MR and 2R calls. NOV holders wishing to receive incoming cards must deposit separate, C5 size, stamped and numbered envelopes with him, clearly showing the special callsign in the top left hand corner. Please be advised that in line with conventional GB cards, special Royal Wedding QSLs will not be re-directed via the home callsign or QSL manager, even if it is written on the card. Contact details for Martin, G0VXC are as per the RSGB Yearbook and RSGB website.

What's different about the 2820? It's receivers and transmitter are designed to support the requirements of digital modulation.
The TS-2000 is primarily designed as an HF radio with VHF/UHF and FM as secondary function. It has the wideband taps to handle 9600 baud data, but the coupling between receiver and transmitter in cross-band repeat mode is probably basic audio. Audio is highly processed in an FM radio.

A quick google found the following
http://www.cliftonlaboratories.com/fm_receivers_and_de-emphasis.htm
Look about 2/3 down the page at the FM pre-emphasis and de-emphasis curves as an example of how much audio processing occurs in FM. That just plays heck with the square waves of digital transmissions.

Hi Martin,

Just to clarify, please, were you referring to the "R" as the prefix in the DSTAR callsign field for the DVAP? Do you mean the suffix in the callsign field? I'm confused.

I don't know if it matters for purposes of the QSL card which designator is used, so long as it is the callsign used during the QSO being confirmed (?) for the DSTAR / DVAP QSO being made.

If I am missing something, my apologies in advance!

1045. Cross-band repeating with dual-band radio (was Re: Dvap output power Help)

Yahoo group: DVAPDongle
Date: 2011-04-28 01:18:39 UTC
From: ipscone
Topic: 1043 Message: 1045

I have read that the carrier type is different for a D-Star radio vs. an analog radio. It's apparently more than just the encoding.

I too have tried this on the FTM-350, without success.

But others have said it's possible to make it work and have done it. I just don't know how, nor have I pursued it any further than a simple test.

From: tomtull@ymail.com
Topic: 1047 Message: 1047

Has anyone figured out how to stop over loading DVAP with 5 watt mobile?
I am a truck driver and got my DVAP today but worried about my 2820 overloading the DVAP and cutting out.
Would putting a small 2 meter antenna further from the radio and on the outside of the truck help?
What is the overload time?
If I only key down for about 30sec at a time would that be ok? Or is it a compounding problem?

Thanks,
Tommy

Dean,

You probably won't find one on D-STAR. The reason being is that the repeaters have a hard-coded 3-minute timeout. That makes any broadcasting essentially impossible.

I would recommend NASA TV on the Internet. Usually has some really great feeds.

The first question I have is how do you know you are going to overload it? I use my 92AD on super low power, about 300mw, and I sit right next to the DVAP with no problem.

I would put the antenna as far away from the DVAP as you can.

Agreed. I practice the rule only use as much power as necessary and
even I sometimes forget to set my 91AD to low in my office. The DVAP is
12' away and have experienced no problems.

I typically set my DVAP to low power and use a stubby antenna on my HT.
This works around my home fine.

* Make sure that the radio is on its lowest power setting.

* Place the DVAP as far away as possible from the 2820 antenna.

* You can use an extension USB cable to place the DVAP a number of feet away, maybe even under the seat

* Replace the DVAP antenna with a 50 ohm dummy load.
The amount of time that you key down should have no impact on overload.

The 2 won't really come into play with each other.

With the DVAP you are going to be creating setups to link to either repeaters with gateways and or reflectors.

Once connected you will have another memory channel to talk on whatever you just connected to.

And you will also have a memory to Unlink from whatever you connected your DVAP to.

There really area no calculations using a DVAP, it's pretty straightforward.

The Dvap is accessed through simplex frequinces with all the same callsigns
for repeaters etc. The only difference is that you connect to the DVAP
through a simplex frequince rather than a repeater, so most of the
programming you have done should be OK.

Another thought/question.

You mention different IP sources, but has all the cutting out been happening on one computer or many?

Try swapping out the USB cable?

Try a different PC/MAC/OS?

Have you updated the firmware on the DVAP?

Go to the DVAPdongle.com website and download the firmware updater,
quite simple to do.

May or may not solve it but at least that will at least eliminate that
from the troubleshooting.

The 2 won’t really come into play with each other.

With the DVAP you are going to be creating setups to link to either repeaters with gateways and or reflectors.

Once connected you will have another memory channel to talk on whatever you just connected to.

And you will also have a memory to Unlink from whatever you connected your DVAP to.

There really area no calculations using a DVAP, it’s pretty straightforward.

Subject: [DVAPDongle] Icom 91A and RT Systems programming software

I use RT systems software to program the correct D-star settings with their D-Star Calc module. If I buy an DVAP Dongle will all of the settings work or am I going to have to make a bunch of manual corrections to make it work? Anyone have any ideas??

I've tried different computers, and both OS X & Windows. Swapped out the USB cable and the firmware was shipped to me with the latest revision. Still the same results.

I've posted another video that shows the DVAP lights while the radio is receiving:
http://www.youtube.com/watch?v=xpVDMVYIXUw

Thanks for all the help. Hopefully we can figure out what's wrong.

1062. Re: Audio Cutting Out

Yahoo group: DVAPDongle
Date: 2011-05-04 22:50:38 UTC
From: RFBoughton
Topic: 1053 Message: 1062

Bobby,

I had what I think is a similar situation when using my IC-92AD, but found that 'Weather Alert' was on and the rig was cutting away to check the weather frequency every five seconds.

The IC-80 manual, page 155, says, in part, "NOTE: While receiving a signal on a frequency other than the Weather alert frequency, the receiving signal will be interrupted momentarily approximately every 5 sec. when the Whether alert function is ON. These interruptions cease when the Weather alert function is turned OFF."

Regards,
Bob

1063. For Sale: Icom IC-80AD Dual-band (one-band-at-a -time) FM / D-STAR HT

Yahoo group: DVAPDongle
Date: 2011-05-04 21:15:11 UTC
From: Mike Besemer (WM4B)
Topic: 1063 Message: 1063

For Sale: Icom IC-80AD Dual-band (one-band-at-a -time) FM / D-STAR HT

Purchased new in August 2010. Rarely used - includes all original items supplied and original box. Fully functional and in great cosmetic condition. From my home in Kathleen, I can easily hit the Gray DSTAR repeater on 5 watts using my attic-mounted J-Pole. SMA to BNC adapter included to allow connection to external antenna.

Also includes optional HS-85 PTT/VOX headset and OPC-1529R programming cable. Programming software is available as a free download from Icom.

The IC-80AD is currently selling for $429 at Gigaparts and $439 at HRO.

The HS-85 is selling for $84 at Gigaparts and $99 at HRO. The OPC-1529R is selling for $35 at both Gigaparts and HRO.

Total value of the package is $548 minimum. Asking $420 shipped via USPS Priority Mail. US ONLY – I’m not going to deal with U.S. Customs. Payment by Cashier’s Check, Certified Check, Postal Money Order.

Reason for selling: I tried DSTAR and don't like it.

Specs:

Frequency Coverage:

Receive, 0.495-823.990, 849-868.990, 894-999.990 MHz

Transmit, 144-148, 420-450 MHz

Modes: FM, FM narrow, AM (receive only), WFM (receive only), DV

Power output: VHF and UHF, 5.0 W high; 2.5 W med; 0.5 W low; 0.1 W s-low.

For complete specs, see:

<http://www.icomamerica.com/en/products/amateur/handheld/ic80ad/default.aspx>

and

<http://www.icomamerica.com/en/products/amateur/handheld/ic80ad/IC80AD_QSTReview.pdf>

Please contact me off-list at mwbesemer(at)cox(dot)net if you are interested.

73,

Mike

Is the Weather Alert feature turned on? This feature polls the NOAA weather frequencies every 5 seconds looking for alert tones, and on my other non-dstar radios, cuts the audio just as you describe...

1067. D-STAR Photos Needed for Dayton

Yahoo group: DVAPDongle
Date: 2011-05-10 13:35:01 UTC
From: wb4qdx
Topic: 1067 Message: 1067

WE NEED YOUR D-STAR PHOTOS!!!

Send us your D-STAR related pictures from the past year and we will create a slideshow in the D-STAR Info in Audio Alley Booths 0097 and 0098. We want your photos of D-STAR repeaters, D-STAR radios, your D-STAR projects, hotspots, homebrew repeaters, D-STAR gatherings and anything D-STAR.

Please send your photos before Wednesday, May 18th to have them included. Then stop by the booth or come to the D-STAR Across America event on Friday night at 7:00pm at the Drury Inn Ballroom to see all the photos from across the D-STAR world.

SEND PHOTOS TO info@...m by Wednesday, May 18th.

1068. Dayton Hamvention D-STAR

Yahoo group: DVAPDongle
Date: 2011-05-11 02:56:45 UTC
From: Woodrick, Ed
Topic: 1068 Message: 1068
Attachments: 3 described; binary payloads are missing from this source WARC

[Description: Description: Hamvention 2011][Description: Description: D-STAR Info]
Again this year, the Dayton Hamvention<http://www.hamvention.org/> will be a hotbed of D-STAR Activity. There are a number of events, forums, and exhibitors all scheduled to be there and of course we can't forget all of the vendors with the best prices on D-STAR equipment!
For more details and updates, check out www.DSTARInfo.com<http://www.DSTARInfo.com>. The latest information will be posted there.

Local D-STAR repeaters
Call Sign

Location

Frequency C Module

Frequency B Module

W8HEQ

Dayton

145.2700 -0.6000

444.0875 5.0000

W8RTL

Dayton

147.1050 +0.6000

The W8HEQ C module has decent coverage outside at the Hamvention; the W8HEQ B module has marginal coverage. The W8RTL repeater has been relocated to Dayton, but is currently does not have a gateway, but hopefully will by the time of the Hamvention.
REF038C will be the Dayton Hamvention Reflector. All stations from outside the region are requested to connect to REF038C and not the local repeaters.
For additional repeaters along your route of travel, check out the repeater listings at www.DSTARInfo.com<http://www.dstarinfo.com/> and www.DSTARUsers.org<http://www.dstarusers.org/> .

Hello,

I have just arrived back home from Dayton and am really excited about getting going with Dstar. I purchased the Icom IC-80AD and DV Access Point Dongle. Apparently the gentleman that registered me yesterday at the the Georgia Dstar booth did not process. Can you please assist me and see if my call W4KMG is registered on the gateway or any Georgia repeaters?

God Bless and Thanks

I have actually found out where I am registered on the Lawrenceville, GA repeater:

WD4STR Lawrenceville United States, Georgia Gateway 145.0600 +1.4000 440.5500 +5.0000 1298.0000 RPS

I am still having issues transmitting but have been at it all day and so ready to transmit :) Do I have the ability to transmit anywhere now that I am registered on the WD4STR repeater? In other words, I am wondering if I am able to transmit on any reflector now?

I have the cloning software for the IC-80AD I purchased in Dayton and put the following into the following into the "Your Call Sign" slots:

REF001CL

I am no expert of course but at least I can monitor the reflector

Thanks
Wes

I believe John Davis is the one responsible for approving your registration. He was in Dayton too so it would be hard for him to do that from there unless he had some free time. Give him a day or so.

I take it you purchased a DVAP and an 80. Congrats. I have the DVAP and 91AD and it works well together. Nice to be able to link where I want to from home or when I travel.

73,
Chris k4fh

Yes, you must only register on one repeater, then you can access any repeater or reflector in the network. It can take up to 24 hours for your registration info to propagate throughout the network, however.

once registered you can connect to any gateway/reflector and transmit. You only need to register on one system

Yes, you can transmit now. You will need to use the REF001CL to connect to Reflector 1 as an example, then you would transmit with just CQCQCQ in URCall. I have this set up with memory locations. One to link with the repeater or gateway I want to link to, then one to disconnect as well as another to use for transmitting with. To disconnect, you just put a U in the 8th position and it should disconnect you from whatever you are connected to.

1077. Problem with DVAP

Yahoo group: DVAPDongle
Date: 2011-05-26 02:25:10 UTC
From: Robert, N4IJS
Topic: 1077 Message: 1077

Good evening,

I purchased a DVAP at the Dayton Hamvention. Got it installed and working on two different computers. All was working great!

However, today I found that it was not working. Both computers no longer show the device and neither of them recognize the device when I attach it to the computer. The green LED pulses, but that's it. Both computers respond the same way and I have tried a different USB cable as well.

Any thoughts what might be happening and how I can fix it? (One computer is running Windows 7 Ultimte (64-bit) and the other is running Windows Vista Ultimate (32-bit) and there were no changes made to either computer since it was working.)

Thanks and 73,
Robert Kluck -N4IJS

Sounds like it has bit the dust.

I have hooked mine up to Linux, Windows (lots of flavours) and Mac,
without any problems, so my guess is it's time to contact the supplier.

Hi Robert. If the green light is pulsing, it should be talking to the computer properly. Can you look in the Device Manager listing and search for the DVAP under comm ports?

I other thing I forgot to mention...

When I started looking at the DVAP yesterday, the device was hot to the touch (bottom side of it). It was attached to the computer and the DVAP Tool was running, but there had not been any activity for a day or so. I have it in an open area, so there should be plenty of air circulation.

Not sure if the temperature is normal for the device, but wanted to pass that along.

Again, thank you for all of your help! It is a great device when it is working.

Subject: Re: [DVAPDongle] Re: Problem with DVAP

Good afternoon Robin,

Yes, I did that already and it does not show up. I tried to install it on a computer at my office and the machine did not recognize the device being plugged into the USB port. However, even without the drivers being installed on this machine, the green LED pulsed (I thought that was odd). Oh, I also have a DV Dongle on my home PC and that still works FB .

On my Vista machine at home (with is a laptop), when I attempt to run the DVAP tool, it tells me that there are no Dongles on the machine. On my Windows 7 machine, it sees the DVDongle , but that's all. I shutdown and restarted my Windows 7 machine thinking that maybe one of the USB controllers was in a weird state, but that didn't help.

I suspect that the device has failed for some reason, but I am not sure why that has happened. Is there any thing I can do at this point to further troubleshoot it?

Thanks for your help and 73,
Robert - N4IJS

Sadly it sounds like you may have a lemon.

I run mine sometimes all day, and it does not even get slightly warm, so clearly something has released it's smoke.

From: bpkelley1
Topic: 1084 Message: 1084

Hi all:

I'm still new to the world of D-Star and the DVAP. That said, I've managed to connect to various reflectors and chat. Until today, that is. Now when I connect I get a message that says, Remote System Linked - Receive Only. I've checked my settings and I can't see that anything has changed.

Does anyone have a suggestion that I could try? My callsign is N8KB. Thanks,

Brent

Simon,

Have you added a suffix such as N or A or something. Also have you checked your spacing. If you are using a new suffix that will need registering as well.

Cheers

From: Jan Timmers
Topic: 1089 Message: 1089

I have a DVAP (have had for more than a half a year), and use my Icom 92AD with it. I used this combination to make quite a few contacts up until a few months ago. Then some other things came up, and my time was spent away from the radio - for about 3 months - til today. I had some spare time, and wanted to connect to REF001C just to ragchew with anyone monitoring. I got the "gateway unknown" recording when I try to connect. I've connected to many other reflectors without any problems. I show up on the "dstarusers lastheard" site on any repeater or reflector there, that I've connected to. I haven't changed anything in my radio - I had programmed into memory all the frequencies that I had connected to many months ago. The DVAP itself is still connected to the same computer it's been since I purchased the DVAP (running Windows XP). Is there something I'm doing incorrectly, or has something changed with the dstar system that I'm unaware of? Thanks for any info.

It is possible that REF001 was temporarily down when you tried. Just click "Close" and "Open" again to repopulate your gateway list.

1097. ARVN Video of Complete 2010 Dayton D-STAR Forum

Yahoo group: DVAPDongle
Date: 2011-06-04 02:11:34 UTC
From: Gary Pearce KN4AQ
Topic: 1097 Message: 1097

Hi, everyone,

I've just put the ENTIRE 2010 D-STAR Friday Afternoon Forum from the Dayton Hamvention up on my <http://arvideonews.com/>web site. This isn't a preview, it's the whole thing! YouTube just lifted my 10 minute restriction, and I'm celebrating - woohoo!

Well, really I feel bad that I never got to editing the 2010 Hamvention footage. But I'm getting an early jump on everything I shot this year, and I'm including stuff I did last year, and this is first out of the box.

This is 2010, not 2011. 2011 is coming in a few weeks. But there's lots of really good, and still current info in this forum. It has Robin Cutshaw AA4RC on the DVDongle, DVAP and DPLUS; Dan Smith KK7DS on D-RATS; and David Lake G4ULF on his non-ICOM D-STAR repeaters.

If you've never seen an ARVN DVD, this is a good introduction. There is a lot of ham radio and Hamvention footage on YouTube. I think you'll see... and HEAR... a big difference with ARVN. The presenters are miked. The audience is miked for Q&A. Multiple cameras, including one dedicated to the slide screen so you see everything. No boomy, reverb-filled sound, shaky cameras and fast swishes to the slides (or missing slides). And they're edited to remove the dead spots, like when computers doing the presentations crash! (Maybe we should leave that in).

So this one's free! I can't do it ALL free, sadly. But the DVDs are reasonable - typically $15 to $20 (Dayton DVDs are $15, plus $3 shipping).

It's in the Dayton section of my web site: www.arvideonews.com. There's a little link at the top right - I'll be making a bigger splash once the whole 2011 collection is done.

While you're there, check out "The Last BIG Field Day," my new documentary. Not one second of D-STAR, but hams don't live by bits alone, except maybe Robin.

1100. DVAP MAC OSX Sound Files

Yahoo group: DVAPDongle
Date: 2011-06-04 12:33:36 UTC
From: Tom J
Topic: 1100 Message: 1100

I just set up a DVAP and use it with a Mac on OSX Leopard. I was trying to find the dvrec sound files but can't find them. The only time a dvrec file appears is when I use the record function on DVAPTool when dvaptool.dvrec appears in my Applications directory.

Does anyone know where the sound files are located on the Mac? I looked and didn't see them in the contents of the app either.

Thanks and 73!

Attachments: 2 described; binary payloads are missing from this source WARC

From my understanding, the recordings are in the app. If there are appropriately named recordings in the execution directory, the software will used those instead of the embedded ones.

From: Tom J
Topic: 1077 Message: 1103

Robert,

From what I've read so far, it could be fried. Have you opened it up and looked for any burn spots on the board or any components?

Some things you can try to do "just in case" are as follows:

- Remove anything and everything from your PCs relating to the DVAP and the FTDI driver. One way to do this is to open the device manager and look for USB and COM settings related to the DVAP. If you are Windows savvy with the registry, remove anything there relating to the DVAP and FTDI. Then - reinstall everything as though it was a new installation.

- Try using the different USB sockets on your PC. I've seen where one socket will work and others won't for some reason.

The fact that the DVAP allowed the green light to function on your work PC without installing anything doesn't mean too much. The PC could have had the FTDI drivers installed for something else. You could try taking the drivers and installing them on that PC to see if you can get it to work.

Good luck and 73!

Hey folks. One of the most frequent questions in the booth at Dayton this year was "what are you working on?" So, rather than just post new stuff here when it is released, I decided to start using twitter and youtube to update things as they are happening. The account name on both is aa4rc. I hope to keep these pretty active with DV Dongle, DVAP, dplus, reflector, and other D-Star development news.

I'm at Apple WWDC this week and posting frequent updates on twitter. If you aren't interested in Apple developer news this week, you might wait a week before subscribing... :)

As usual, new stuff will be posted here as it is released.

1106. Internet Port information needed

Yahoo group: DVAPDongle
Date: 2011-06-13 03:55:16 UTC
From: risharde
Topic: 1106 Message: 1106

Hi everyone, I need more information on which ports I should open on my firewall to allow DVAPTool to work properly. The website is horribly poor in terms of any information concerning this - in fact, I have found no information concerning which UDP and TCP ports should be opened.

Why is this necessary? For the sake of your computer network, you should be running a firewall. I actually had to add the computer with the DVAPDongle to the DMZ which is not the best practice until I can get this information.

NOT GOOD AT ALL... I am hoping the developers can shed some light on this so I can add rules to my firewall for incoming and outgoing information.

Thank you

The reason that there is no port forwarding documentation is that you don't need to do it. All connections are outbound.

From: LC34747
Topic: 1106 Message: 1108

This is the first time I recall seeing this question asked. I know of no one that has had to worry about this. Since all traffic is outbound there should be no port issues.

I am curious, since you speak of putting the computer in the DMZ if you are trying to use the DVAP on a network at work or something. If so or even if you have a DMZ on your home network and it works when the computer is outside the firewall, you are likely on the right track looking at your firewall, but it would be something other than port forwarding.You don't say what firewall you are using.

Robin,

It's not possible that all connections are outbound. If that were the case, you could never hear people on the reflector / repeater you are connected to. There has to be bi-directional communication.

I'm not sure if this helps, but it's from a simple google search and may be the answer risharde is looking for:

http://dsyncg2.dstarusers.org/info/#ports

Description Port No. Protocol
Voice Receive 40000 UDP
Data Receive 40001 TCP
Data Sync
dplus 20001-20005 UDP
TCP

Note: Port 40002 is also used by the gateway software for OUTBOUND use only and does not need to be forwarded.

I saw in the FAQs of the DVDongle port 6116 was used. Not sure if that is local or if it had anything to do with internet communications.

To Risharde - please advise if this works for you. Also - try to come across a little nicer next time.

From: Tom J
Topic: 1100 Message: 1112

When I look in the contents of the .app file, there are no sound files. There are .dylibs, your traditional .plist, DVAPtool executable, pkginfo, an icon, and lproj file. Doing a global search for any files with dvrec only turns up the one with recorded audio I did during some echo tests. The files have to be somewhere but I'm not having any luck finding them.

Thanks,
Tom

Is it possible that you have some personal firewall/spyware/port-blocking evil software installed on your PC?

I have recently assisted a DVDONGLE user who could not transmit and the issue was a software package called AVG I believe.

In any case, once he punched a hole in that, his DONGLE is up and running FB.

Subject: [DVAPDongle] Internet Port information needed

Hi everyone, I need more information on which ports I should open on my firewall to allow DVAPTool to work properly. The website is horribly poor in terms of any information concerning this - in fact, I have found no information concerning which UDP and TCP ports should be opened.

Why is this necessary? For the sake of your computer network, you should be running a firewall. I actually had to add the computer with the DVAPDongle to the DMZ which is not the best practice until I can get this information.

NOT GOOD AT ALL... I am hoping the developers can shed some light on this so I can add rules to my firewall for incoming and outgoing information.

Thank you

Hi Tom. You are looking at ports for a gateway, not a DVAP. DVAPTool makes only outbound connections. Once a connection is made, the data flows in both directions. No firewall changes are required for that to happen.

Topic: 1100 Message: 1115

Hi Tom. Have you read the documentation labeled "Customizing Voice Message Playback" at dvapdongle.com under the "Using the DVAP" section?

The voice messages you hear by default are compiled into the executable. You only need to create new ones as described above to have them used instead of the defaults.

Hi Tim,

That may well be but I can tell you that I recently assisted another HAM who had AVG on an XP box.

I was working in remotely and assisting him.

When he accessed some setting on the AVG software, it asked if the DVDongle software should be allowed etc. (While the dvdongle application was open)

I clicked on something to the effect of yes, and make this permanent and the issues went away of him not being able to transmit.

I saw it with my own eyes.

```
I know this is quite late, but I solved this a different way...

------------------------------------------------------------

su -

cd /<path/to/your/installation/directory>

chown root DVAPTool

chmod 4775 DVAPTool

exit

------------------------------------------------------------

Explaination:

4 - Sticky bit set - run this as the owner uid no matter who runs it
7 - Read, Write, Execute authority for the owner
7 - Read, Write, Execute authority for the group
5 - Read, Execute authority for the world

This will work too...

Careful with that, it opens a big security hole. However, if you are the sole owner/user on the machine, then it probably doesn't matter.

1123. Voice ID and Echo Test Configuration

Yahoo group: DVAPDongle
Date: 2011-07-02 01:06:18 UTC
From: KenK
Topic: 1123 Message: 1123

I'm running CentOS 5, but I think that's irrelevant, because the problem I see is actually in the IC-92AD.

In the IC-92AD CALL SIGN field, if you program "DVAP___I" or "DVAP___E" the DVAP either identifies itself (if you've recorded and saved a dvap-id.dvrec file or echos whatever you speak into the microphone.

This feature only works once immediately after you program the CALL SIGN. When you change to another memory location and return to the above, the 3 spaces are compressed to one...

I've sent a question to ICOM about this, but depending on their answer. Would it be possible to rewrite the DVAPTool to look for I or E in the 6th position or enable some other padding character?

I heard a guy on REF001C today who said <paraphrasing> "I'm mobile with a laptop..."

I have a WiFi Hotspot Application in my iPhone and have used it to demo a DVAP at a Ham Club Meeting where we had no internet access. It worked quite well...

<GEEK ALERT>

I was thinking about how to port the DVAPTool to run on an Arduino. (If you don't know what Arduino is, please visit http://www.arduino.cc/)

This would reduce the footprint and power consumption to almost NOTHING!!!

<GEEK HUMOUR> you could practically ductape this to an HT and power it off of its battery!!! </GEEK HUMOUR>

</GEEK ALERT>

Any takers?

This description has the earmarks of a common problem that bites even experiences radio users.

You have a parameter (a wrong YOUR call sign, in this case) programmed into a memory. Then you make a change to that parameter, but you don't re-store it over the original memory. The new parameter works until you switch away from that memory, then switch back, at which point the old parameter "mysteriously" returns.

That may or may not be what's happening here, but it's the first thing I'd check. I've done it more than once, but I've never had a memory change values any other way.

From: Tom J
Topic: 1123 Message: 1130

I have a 92AD and don't have this problem either. I can run the memories all I want, go back to DVAP I or E and it works like a champ. Not sure what could be causing your issue. If I were to guess, it would be you saved it once with the I or E in the 6th position, went back to correct it, and didn't save it again.

Good luck figuring this one out. Please let us know what you find.

It seems to be isolated to a few memory locations. I just had a buddy try to replicate the issue, but alas no...

And when I put this in another memory location it works fine...

1133. Running DVAPTool as a service?

Yahoo group: DVAPDongle
Date: 2011-07-06 18:48:22 UTC
From: KenK
Topic: 1133 Message: 1133

I'm running in CentOS and I thought it would be nice to be able to start the DVAPTool with an init.d script and run it as a service...

The commandline options that I've seen ALL launch the little GUI window that really is superfluous!

I'd rather configure it and let it fork its log to a file...

Thoughts?

1134. How Can I Fix This...

Yahoo group: DVAPDongle
Date: 2011-07-08 01:01:14 UTC
From: John Kintz
Topic: 1134 Message: 1134

I can't seem to find a answer to this issue anywhere -

What causes DVAPTool to say "Remote System Linked, receive only" (or words to that effect) and what can I do to fix it?

The first time I heard it, I was using my netbook with a wireless connection. But I have since also heard it often when using my desktop with a direct network / DSL internet connection.

Comments??? Suggestions???

Thanks in advance,

John

Is there a particular reflector or repeater you hear this on?

Does it happen all the time?

Hi John. Make sure that you have not modified a local host file for the name server. Also make sure that the character you are using in the 8th character of URCALL is registered.

Hi Robin -

This issue occurs when first linking with the reflector. At that time, the URcall field is set to "REF001CL" (without the quotes). The DVAP then reports ... "Remote System Linked - receive only".

I don't fully understand your comment re the 8th character of URcall... When linking with the DVAP, the 8th character is usually L (for link), U (for unlink), or URcall is CQCQCQ for talking. Is this not correct?

In the past, I have linked with the reflector successfully (i.e. - not receive only), but lately I always seem to get the "...receive only" message from the DVAP.

John

1139. Re: How Can I Fix This...

From: Terry
Topic: 1134 Message: 1139

Make sure, as Robin already suggested, that you are using the correct callsign and device id combination. You registration shows 2 listed:
Registration Information: Registr.Call Registration Server Date of Registration IP-Address-Pool AC4JK AK4EG 2011-06-14 07:49:02 10.68.52.224-
10.68.52.231

Activated Terminal-IDs: <http://dstar.prgm.org/DStarTerminalIDs.html>
Device Call/ID Registration Server IP-Address Last Heard Repeater Gateway AC4JK A AK4EG 10.68.52.225 2011-06-28 15:57:31 KJ4JAL B KJ4JAL AC4JK AK4EG 10.68.52.224 2011-06-15 16:50:02 AK4EG A AK4EG
Registration OK!

Any registered D-Star user can verify their settings on the gateway they registered at or one of the several query tools:

https://wb1gof.dstargateway.org/cgi-bin/dstar-regcheck
<https://wb1gof.dstargateway.org/cgi-bin/dstar-regcheck>

http://query.ki4swy.org/index.php <http://query.ki4swy.org/index.php>

1141. 2010 Dayton Hamvention D-STAR Forum Video

Yahoo group: DVAPDongle
Date: 2011-07-09 14:21:47 UTC
From: kn4aq
Topic: 1141 Message: 1141

Almost 600 people have watched the video of the D-STAR Forum at the 2010 Dayton Hamvention® since I put it up on the ARVN web site <http://arvideonews.com/> last month. That's the whole forum, not a short preview! (It's still there, if you haven't seen it. There's a link at the top-right of the home page).

Some stats:

* By comparison, the 2008 and 2009 D-STAR forums, available only on DVD, have each sold about 100 copies (which is adequate, but not stellar, from my perspective as producer). The DVDs are $15/ea.
I'm surprised that more haven't watched, considering the wealth of information in the 2010 forum, and how "accessible" it is (generally easy to understand for new D-STAR operators). That probably has as much to do with how many people are aware of it as how many might be interested in it. I made one brief announcement here on the Yahoo list, which was reposted to a few other lists. This announcement will likely spike viewership again. By the way, the 2008 Forum (and Friday Night Event) is a classic of history, fun and information. It's rare to have this kind of documentation of the early years of a significant niche in ham radio.
* The viewer "attention" graph provided by to the channel owner by YouTube shows attention for the video slightly "worse than average" compared to other videos of this length (90 minutes). That measures how many viewers keep watching, replay segments, or "tune out," and the graph shows a running average throughout the video. Attention takes a big jump up in the last quarter of the video when G4ULF describes how he builds D-STAR repeaters out of non-ICOM equipment (his favorite: Tate <http://www.taitradio.com/> , a name not too familiar with US hams).

* 65% viewers are between 45 and 65 years old. 5% is female. You can watch without logging into YouTube, and I'm assuming those stats are generated by people who have logged in. Since most people are watching on my web page, not directly on YouTube, I'll assume that most viewers are not logged in. But those stats align pretty well with those for my other ham-radio-related videos that are mostly viewed on YouTube. (And come to think of it, with all the stories about how much Google tracks us and knows about us, maybe they do know our age and gender without logging in.)

* 77% of viewers are in the US. 11% in Germany, 11% in Japan.
I am actively editing the rest of the 2010 and 2011 video from the Hamvention, including the D-STAR Forum. There's a little slowdown while we have some renovation work done at the KN4AQth, but it'll be done this summer.

Alrighty, then... THAT was the issue - kind of. The station callsign field in DVAPTool was off by one space, so that the callsign did not agree with the registered callsign.

I was not aware that the "A" in my secondary call needed to be in the 8th space in DVAP as well as in the radio. Apparently, if the call in DVAPTool is not recognized as registered , you can connect to a reflector - but for receive only. Good to know!

Thanks everyone for pointing me in the right direction.

73 to all,
John

1145. DVAP Unbuntu

Yahoo group: DVAPDongle
Date: 2011-07-14 02:06:18 UTC
From: Tommy
Topic: 1145 Message: 1145

I have downloaded the Linux DVAP Tool and extracted it to the desk top. When the DVAP is pluged into the USB port it flashes green. When I start DV Tools and click open it looks like it is going to work but then it says "Unable to query DVAP Dongle device".
I am running Ubuntu 11.04 I have "removed" "brltty"
I have not installed any USB drivers. As the DVAP website says the USB drivers should come with Linux. The green light flashes and the blue one flashes when I click "Open". So I don't think I need the USB drivers.

Help please.

Thx,
Tommy

Hi Tommy. Are you running any other USB to serial devices? If so, you might need to select a different device in the option box in DVAPTool. Also, you might try running as root just to see if it is a permission issue.

1147. Re: Running DVAPTool as a service?

Yahoo group: DVAPDongle
Date: 2011-07-14 19:22:26 UTC
From: Mike Heitmann
Topic: 1133 Message: 1147

I run mine in a VNC session on a Fedora 14 system. No display required. In fact, the system boots up in a non-graphics environment.

The startup script for launching DVAPTool tee's the output that would normally go to the terminal to a log file in the VNC user's .config/DVDongle.com/ directory (where the config files are also located). It also has the benefit of being able to connect to the running VNC session anytime to look at what's going on using the GUI window.

I haven't gone so far as to make it login and start the VNC session on a reboot, but I've thought about it.

Mike, N0SO
PS: I do the same thing with my d-rats "ratflector":

No other anything. fresh install of Ubuntu 11.04
I don't know what you mean "root" I know nothing about Linux.
The only reason I am running Linux is so I can leave this old gateway laptop running with dvtools stuck away and left running in my "Big Truck".
The only thing I have done is "Removed" that "brltty" thing.
Now that I think about it that might be the problem.
The drop down always says "dev/ttyusb1" or "dev/ttyusb0"
From the windows version it would only say things like "USB1"
So all this "dev" stuff I am not sure of.

Hi Tommy. If you have both a /dev/ttyUSB0 and /dev/ttyUSB1, there are two USB based serial devices on your system, one being the DVAP and the other unknown. Have you tried selecting both devices (one at a time) and clicking "Open"?

Also, make sure the DVAP is plugged in before starting DVAPTool.

Very often DVAPTool gives me the same error (I am also running Ubuntu, but v. 10.10) when I try to open the DVAP. If I hit the button again right after the failure, it opens right up and runs like a champ for weeks on end.

Try to open the DVAP again after the failure and see what happens.

Tommy,

I am also running Ubuntu 11.04
It is my experience that every time when Ubuntu is power on/rebooted I have to unplug and replug the DVAP device.
Ubuntu apparently is unable to init it during boot.

Try it ;-)

Hi,

IMO it would be very nice if Robin offers the new DVAP Tool to run as a Web server.
This would make it possible to access it with any populair Web Browser from not only Linux platforms...

Regards,
Bert

Op 14-07-11 21:22, Mike Heitmann schreef:

I run mine in a VNC session on a Fedora 14 system. No display required. In fact, the system boots up in a non-graphics environment.

The startup script for launching DVAPTool tee's the output that would normally go to the terminal to a log file in the VNC user's .config/DVDongle.com/ directory (where the config files are also located). It also has the benefit of being able to connect to the running VNC session anytime to look at what's going on using the GUI window.

I haven't gone so far as to make it login and start the VNC session on a reboot, but I've thought about it.

Easy fix. Stop using the screen saver! With today's technology on monitors you should need to worry about the image burning into you monitor.

Is it the screen saver or the machine going into sleep mode?

There's definitely options to control what the machine does when it times out, just need to check them out.

1169. Need help getting started

Yahoo group: DVAPDongle
Date: 2011-08-10 20:17:46 UTC
From: w4phs
Topic: 1169 Message: 1169

I have an Icom IC-92AD, and I just purchased a DVAP. I need help getting started.

I have the drivers installed, and DVAPTool is talking to the DVAP, showing the device serial number, and displaying status information when I press PTT.

I previously registered on my local gateway as "W4PHS" without a suffix letter, so that's what I put into DVAPTool for my call sign (no suffix letter).

I understand that I should put DIRECT into both the R1 and R2 fields.

I tried to connect to Reflector 30C by putting REF030CL as UR, and the status window shows:
"Starting Link request <REF030CL>".
"Login OK, transmit not permitted on REF030."

Why is transmission not permitted?

I then changed the UR field to try to get into my local repeater by putting KI4SDICL in UR. This time the status screen said "Connect request while currently linked".

By the way, each time I transmit the status screen shows "Checking callsign <W4PHS > against call station <W4PHS??|>" Neither my radio nor DVAPTool have "??|" at the end of my call sign.

Thanks for any help.

Phil

Hi Phil. It looks like your registration had not made it through the network until a little while ago. Try linking into REF030 again.

You don't have to put DIRECT in RPT1/2 since the radio will do that for you in simplex mode.

In your connect example below, you linked receive only. You need to unlink before relinking somewhere else. That is why you got the currently linked message.

I'm not sure what is going on with the garbage characters in your display. I have not seen that here. It looks like everything should work now though.

DIRECT is added to R1 and R2 automatically when you key in with REF030CL in the call sign of the 92ad.....once you get "System linked", don't forget to switch the call sign back to CQCQCQ so you can transmit.....

From: aa4rc
Topic: 1171 Message: 1174

Hi John. I'm not sure I completely follow your question.

The DVAPTool program sends a keepalive packet to any connected system once per second. The connected system also sends a keepalive packet to your DVAPTool once per second. If you have too many missed keepalive packets, either end will disconnect the link.

There is no watchdog message to set.

Joe,

You have been very helpful. I feel like I slept through D-STAR class, because new twists keep coming up.

As I understand your message, I should establish a link using UR=REF030CL first, then switch UR to CQCQCQ when I want to talk. Can I leave R1 and R2 set to DIRECT while talking once I link?

The specification REF030CL links to Reflector 30C. What happens if you leave off the "L"?

If I want to connect to my local D-STAR repeater KI4SDI C, should I put KI4SDICL in UR? Should I link and then switch to CQCQCQ?

One more thing: When I set up the terminal entry with my registration, I put a single space as the initial. I attempted to add a second entry with "A" as the initial for the DVAP, but the registration screen said "Warning: already registered". Do I need a separate entry for the DVAP, or can I use the IC-92AD through the repater and the DVAP with both using space as the initial?

Topic: 1169 Message: 1176

Robin,

Thank you for your message. I completed the second step of the registration process (setting up a terminal) last night, and I was able to get into Ref 30C through my DVAP.

Just to review, I have an IC-92AD and a DVAP. For RF access to KI4SDI I have UR=CQCQCQ, R1=KIRSDI C, AND R2=KI4SDI G. For DVAP, I establish a link to Reflector 30C using UR=REF030CL, R1=DIRECT, R2=DIRECT, then once I am linked I switch to UR=CQCQCQ, R1=DIRECT, R2=DIRECT. If this isn't correct, please let me know.

If I want to use the DVAP to connect to KI4SDI rather than Reflector 30C, should I use UR=KI4SDI G, R1=DIRECT, R2=DIRECT to establish the link and then switch over to UR=CQCQCQ, R1=DIRECT, R2=DIRECT?

The UR field is where commands are placed. A value of "REF010CL" means 'L'ink to module 'C' on 'REF030'. The eighth position is the command, the seventh is the module, and one through six are the system to which you wish to link.

To link to KI4SDI module C, use "KI4SDICL". To talk, use "CQCQCQ " in UR.

Take a look at the "Using the DVAP" section at http://www.dvapdongle.com for more details.

From: Joe Chimento
Topic: 1169 Message: 1178

No problem Phil....you'll get there....just remember, you are sending commands to the DVAP using the UR. When you key up the 92AD the command you typed in the UR gets sent over to the DVAP. So, in my case, I use UR=REF020AL. "REF020" is the reflector I want to connect to, "A" is the module and "L" is the command to link my DVAP to the reflector. Once I key in my 92ad, the command is sent to the DVAP and I get an audio confirmation that the DVAP is connected. I only use this command once. Once link is established, I change UR=CQCQCQ so I can transmit. Anything but UR=CQCQCQ will be interpreted as a command by the DVAP and will not transmit. You can store your UR settings into the 92AD memory....this makes connecting to the DVAP lightning fast with a few keypad clicks.

Hope this helps.....

I own two ID-880s and an IC80-AD. I program the memory channels in all three to do commands. In my case I prefer to use the bank memory channels. Let me give you an example.

Bank A is filled with FM repeaters and simplex channels.

Bank B I use for controlling, commanding, and talking on my DVAP.

Bank C is all D-Star repeaters in my home state of GA.

Bank D has all the D-Star repeaters in an adjacent state, and so on.

Specific to the DVAP bank -

All channels have the same frequency, the one I use with the DVAP. They're all simplex, DV mode.

Channel 00 is my "home" channel where I do ALL the talking. The UR is CQCQCQ and there is nothing in RPT1 or RPT2.
Channel 01 has the "UNLINK" command in it (seven spaces and a U in the 8th position).
Channel 02 tells the DVAP to ID (seven spaces and an I in the 8th position).
Channel 03 is my Echotest channel (seven spaces and an E in the 8th position).
Channel 04 and above contain nothing more than linking commands to reflectors and repeaters.

So, let's say I wish to connect to Reflector 30C. I switch to the DVAP bank if I'm not already on it, turn the channel selector to the channel where I have programmed the link command (I put REF030C in the name field for that channel), and quick-key once. My DVAP says "Remote System Linked." I then push 00 (zero twice) on my keypad and the radio changes to channel 00. I can then make a voice call. When I'm done and wish to unlink, I turn the channel selector one click upward and quick-key. The DVAP says "Remote system unlinked" and I'm done.

I think this method minimizes the effort needed to connect and disconnect from remote systems and reflectors.

I have almost exactly the same configuration as Tim detailed.

Really simplifies operation.

1181. Common reflector

Yahoo group: DVAPDongle
Date: 2011-08-11 22:24:01 UTC
From: Chiefsfan2
Topic: 1169 Message: 1181

Is there a common reflector to DVAP users can connect to for a qso that doesn't go out on RF except at the DVAPS?

1182. Re: Need help getting started

Thank you for your help Robin. I'm up and running.

Here are mistakes I made:

1. I didn't complete the registration by setting up a terminal entry.
2. When I entered my call sign into DVAPTool I didn't pad it to 8 characters, and DVAPTool threw in trash characters at the end of my call sign (I consider this to be a bug).
3. I didn't understand the concept of setting up a link to a reflector and then switching to CQCQCQ to talk after linking.

Thanks again for your help.

Also you might check the power management setting for you USB ports. There is a place to uncheck the setting to shut down the USB port to save battery power. I found this setting checked on my system and unchecked it and solved the problem.

1186. Working on listen only - now registered not working?

Yahoo group: DVAPDongle
Date: 2011-08-22 23:47:15 UTC
From: mark_zl2ufi
Topic: 1186 Message: 1186

Hi All,

I have purchased a DVAP and it was working on listen only mode, so all good there.

I have registered and had to wait for about a week for the Node SYSOP to return from holiday.

I finished the registration and then opened up my DVAP 'to have a go' on transmit.

Now I cannot connect anything at all, and the REF001C says I'm connected (from their screen), but when I try TX'ing there is nothing displayed in the screen.

So I tried unlinking and says I'm not connected?

So I tried connecting to another Reflector and I cannot now connect to anything?

Any thoughts?

Mark ZL2UFI

1187. Working on listen only - now registered not working? Pt 2

Yahoo group: DVAPDongle
Date: 2011-08-23 00:06:10 UTC
From: mark_zl2ufi
Topic: 1187 Message: 1187

Hi All,

I have resolved part of the problem, here is what I did:

I have made a shortcut from the DVAPTool.exe download directory and copied that to the desktop for easy access.

After the previous message (here) I when back into the download directory and loaded the DVAPTool.exe directory NOT using the shortcut - success I can now control the DVAP again.

I can link and now unlink from the REF001C Reflector....

BUT.... I am still only in receive only mode? Why am I I still in receive only mode, and as I am registered why can I not transmit?

Any thoughts?

Mark ZL2UFI

Hi Mark. I looked through the logs and you were using "ZL2UFI A" but have not registered the "A" terminal. I see your last attempt at connecting to REF001 as "ZL2UFI " worked allowing you to transmit.

From: mark_zl2ufi
Topic: 1187 Message: 1189

Hi Robin,

Thanks... I found another message via Google that you had replied to someone else about the same thing.

It took me a while to work out what "not registered the "A" terminal" meant.

For those reading this, remove the A from the DVAPTool e.g. I had ZL2UFI A in the Station Callsign box on the DVAPTool, BUT I had registered on the Gateway as ZL2UFI only. So I removed the "A" and I in business.

Robin, I followed your instructions on the http://dvapdongle.com/DV_Access_Point_Dongle/Using_the_DVAP.html link to the letter. I think perhaps some clarification needs to be made with the adding of the letter A. I followed the instructions and the screen shots and this is what probably put me wrong. Not a criticism just an observation.

1190. Playing DVREC Files

Yahoo group: DVAPDongle
Date: 2011-08-23 06:37:17 UTC
From: mark_zl2ufi
Topic: 1190 Message: 1190

Hi,

Is there a way to play the recorded dvrec files other that by the DVAPTool?

I want to record and then play them back on a PC not via a transceiver.

I searched for an answer before posting so hopefully this hasn't been asked before?

Mark ZL2UFI

Hi Mark. Those files are encoded using the AMBE codec that is used by dstar radios. You can either play them through dvaptool or on a gateway computer through the repeater. The next release of DVTool for the DV Dongle will also be able to play and record the files on a PC.

1193. DVAP Dongle and APRS (findu)

Yahoo group: DVAPDongle
Date: 2011-08-24 14:01:52 UTC
From: ON4BBQ
Topic: 1193 Message: 1193

dear all,

I am new in D-Star. Presently I am hooked up via a DVAP and the IC-92AD + GPS mike . All workes fine (tnx to some help I got in the messages here)but I do not manage to put my position on the net (findu).

My position is forwarded to the DPRS sites OK but not to the conventional APRS sites like Findu, APRS-FI, etc...
(http://ref028.dstargateway.org/)

Could it be that this is impossible if you work via a reflector ? I understand that if you do not work via the DVAP (TxRx to Dstar Rep)you have to select under R2 of the 92ad the gateway that puts you on the net. But I also understand that this selection is bypassed anyway if using the DVAP...

Tnx for your help in this.

Hi Ronald. DVAPTool does not currently provide GPS information to the DPRS/APRS network. That is on the todo list...

For now, you have to talk directly to a repeater to have that information forwarded.

You actually can be found.

I went to the dashboard for the reflector you are on.

http://ref028.dstargateway.org (http://ref028.dstargateway.org/)

I then clicked on your callsign "In Orange"

And there you are.

Miami?

Topic: 1193 Message: 1198

hello Brian,

tnx for your reply.

Yes, I know I am 'visible' on the DPRS (dstar ref) sites but not on the APRS sites like Findu and others;

But Robin's answer makes it clear : the DVAPTool does not (yet) allows forwarding to these others APRS sites.

From: david Korchin
Topic: 1199 Message: 1199

Love this software. It's on 2 Apples and a Linux Ubuntu distro. Always solid.

But I do wish there was a panel that pulled D-star info from the databases, things like Last Heard, Remote Users, etc. so I wouldn't have to toggle among those websites that carry the data. Everything would be in one application. (or is it already there, and I'm blind hi hi)

Any others to add to the Wish List?

Hi David.

I put all those things in the DVTool software for the DV Dongle. The design philosophy behind the DVAP was based on the assumption that you would fire up DVAPTool and walk away from the computer to use your DVAP. Indeed, you may actually cause issues with your computer if you key up right next to it. :)

HI THIS IS N9hsm tom. I have been hearing on Dstar call forwarding,

my question can you do it on a DVAP, DV DONGEL.. OR do you have to have a RPT. to do it. WE Don't have a Dstar RPT HERE IN LOIUSVILLE KY, OR CHARLESTOWN,IN. which is about 18 miles northeast of Louisville ky.

I have talk to 2 other people who just got the IC-880H. and we have fun on simplex. but I have a DVAP. I got them talk into getting a DVAP REAL soon.
thanks you all.. You all have help me since I got into Dstar. Tom N9HSM.

1203. Introduction & First Question(s)

Yahoo group: DVAPDongle
Date: 2011-09-06 01:20:48 UTC
From: Chip G.
Topic: 1203 Message: 1203

My name is Chip, amateur callsign N1MIE. I've been a ham since 1992. At this years Dayton Hamvention I purchased an IC-80AD and a DVAP Dongle. I've only tried a few times to get this working. Frankly it blows my mind every time I try to get it working, although each attempt brings a little learning and gets me further along for the next start. I find the language and process so alien to all my other amateur experiences that it is overwhelming to get all the way there. I think I may be close to my first QSO, but I'm not sure.

1. I did successfully (I think) register with a system. I don't know if there's a way to verify online, but if there is you should find me registered with the AA1HD system (I believe).
2. There are no DStar repeaters close to where I live (not close enough to hit with my HT, although perhaps I could connect if I used my external antenna, I'll try that on my next day off).
3. I went through the DVAP installation process and it appears to work find (I can get it to respond to a "DVAP E" and "DVAP I" commands).
4. I've successfully connected to REF010C, REF004C, AA1HD C, and KB1TMOC using a command like "REF010CL" in the UR space. I've left the RPT1 and RPT2 spaces blank.
5. After linking to above places, I've tried to transmit a test message using "CQCQCQ" in the UR field. I've yet to get a reply. (As I type I have been listening to REF010C for a long time with no activity.)

I'm curious if there are places I can go where I am more likely to hear activity so I can have my first QSO. If my feeble understanding is correct, I can use the above (UR for a repeater or reflector, RPT1 & RPT2 blank) to connect and talk with folks. Given the DVAP setup, what are the purposes of RPT1 and RPT2? Do I only use RPT1 if I'm connecting (on RF) via a DStar repeater?

OK, now I think I'm going to let my brain cool down for awhile.

If I get this figured out soon I may give a presentation on DStar to my local club.

Chip,
Try REF001C it has a lot of activity.

This link will show you the current DSTAR activity. When you transmit you should see yourself when it does a refresh(if you internet options are set) otherwise do a manual refresh.
http://nj6n.com/dplusmon/

I use very low power on my IC80 unless I intend to be a distance from the DVAP.

Hi Chip and welcome to the world of DSTAR.

It appears your registration worked. The busiest reflector seems to be REF001C. One site you can check to see real time activity is:

http://dstarusers.org/

In fact, when you key up, you should see your call appear in the list.

With the DVAP, you are using simplex mode so RPT 1 and 2 are not necessary.

For DSTAR in general, think of RPT 1 as the repeater you are connecting to. You use this to tell the repeater which node you want to talk with - A, B, or C using the 8th position. So the line will look something like "AA1HD C"

RPT 2 is used to tell the system where else you want your signal to go. It seems most of the DSTAR repeaters out there have gateways attached that allow communications through the internet to other repeaters. So you will tend to use RPT 2 with the repeater's call you are connecting to with "G" in the 8th position so your signal will go through the gateway. This is really important if the repeater is connected to a reflector. So the line will look something like "AA1HD G"

An advanced way to use DSTAR is talking directly to an individual on another repeater. In that case, RPT 2 is used to tell your repeater specifically where to send your signal.

Hope that helped. DSTAR is really fun.

73,
Tom

Pretty much 100% correct, Chip!

Try REF001C or REF030C for more activity. There is a web site to check your registration, but I don't I have it here in my phone. But if you are connecting to reflectors, it should be set up right.

Go to www.DSTARUSERS.org and look for your call sign after you connect to a reflector.

Subject: [DVAPDongle] Introduction & First Question(s)

My name is Chip, amateur callsign N1MIE. I've been a ham since 1992. At this years Dayton Hamvention I purchased an IC-80AD and a DVAP Dongle. I've only tried a few times to get this working. Frankly it blows my mind every time I try to get it working, although each attempt brings a little learning and gets me further along for the next start. I find the language and process so alien to all my other amateur experiences that it is overwhelming to get all the way there. I think I may be close to my first QSO, but I'm not sure.

1. I did successfully (I think) register with a system. I don't know if there's a way to verify online, but if there is you should find me registered with the AA1HD system (I believe).
2. There are no DStar repeaters close to where I live (not close enough to hit with my HT, although perhaps I could connect if I used my external antenna, I'll try that on my next day off).
3. I went through the DVAP installation process and it appears to work find (I can get it to respond to a "DVAP E" and "DVAP I" commands).
4. I've successfully connected to REF010C, REF004C, AA1HD C, and KB1TMOC using a command like "REF010CL" in the UR space. I've left the RPT1 and RPT2 spaces blank.
5. After linking to above places, I've tried to transmit a test message using "CQCQCQ" in the UR field. I've yet to get a reply. (As I type I have been listening to REF010C for a long time with no activity.)

I'm curious if there are places I can go where I am more likely to hear activity so I can have my first QSO. If my feeble understanding is correct, I can use the above (UR for a repeater or reflector, RPT1 & RPT2 blank) to connect and talk with folks. Given the DVAP setup, what are the purposes of RPT1 and RPT2? Do I only use RPT1 if I'm connecting (on RF) via a DStar repeater?

OK, now I think I'm going to let my brain cool down for awhile.

If I get this figured out soon I may give a presentation on DStar to my local club.

I'm upstairs reading the file, so I'm using the webmail feature of the groups.

One question that I haven't seen answered yet ... when I connect to a reflector it says "receive only". How do I change that so that it'll let me transmit onto the reflector?

I just heard N9PUZ & KF9L have a QSO on REF001C. I have my UR as CQCQCQ but after the QSO when I tried to call N9PUZ I didn't get a response.

Hi Chip. It looks like you figured out your issue. You initially used an "A" in the 8th position of mycall and that letter was not registered as a terminal. When you switched to a space in the 8th character, it let you connect allowing transmit.

I did with the help of the local SysOp (do they still call them that?). I'm good to go and play. We're going to get that "A" registered as well as I understand the reasons why it is recommended.

Thanks all for the patience with a newbie.

Robin,

Love my DVAP, just wanted to make a quick suggestion. Could we have the option to minimize the DVAPTool to the system tray in the next version? Having to have both those windows open all the time gets on my nerves (I'm OCD about it). Hope you take this into consideration. Thanks!

Hi Scott. Can you not just minimize the windows you don't want to see? Placing an icon in the system tray would use very specific Windows-only code and I'm trying to keep the application consistent across all platforms.

From: jpcurtinae7ld
Topic: 1212 Message: 1212

When I install my DV-AP, it appears that the drivers are loaded correctly. The green LED on the DV-AP flashes slowly. When I download and run the DVAPTool application, I am prompted to check that No DV AP Dongle found. Plug in my device and make sure the green light is blinking. I have repeated this several times, including rebooting my computer (Windows 7 Pro), but because I am doing the exact same thing repeated and expecting a different result, I have joined this Group for someone to tell me what may be wrong.

Thank you in advance.

Boot up your computer first and once it has stabilized, then plug in your DVAP and let the computer recognize it. You may have to unplug and plug-in a couple of time, but wait at least thirty seconds between attempts. My DVAP will almost never work if I boot up the computer with the DVAP plugged in.

Hi, Robin!
I quickly tried what you suggested, but with no luck.

I then moved the DV-AP Dongle to my desktop computer (the initial computer was a laptop. The desktop is a Windows 7 Pro computer. I followed the installation instructions online at the DVAP Dongle website and everything worked okay. When running the DVAPTool, I received the window in which I was able to set up my call sign and frequency.

I then moved back to the laptop, booted the laptop and let it stabilize. I plugged the DV-AP Dongle in (and heard a Windows audible acknowledgement of the plug in). I ran the DVAPTool and received the same message -- No DVAP connected (or whatever). Please verify that green LED is flashing. It was. I "grabbed" the window with the scrolled instructions and moved it to be sure that the DVAPTool window was not hidden behind it to no avail.

I have verified that the DTDI driver is the proper driver.

At one point this morning, it occurred to me that the Norton Internet Security may be blocking things, but the desktop is configured similar to the laptop with Windows 7 Pro and Norton Internet Security.

Is there someway to "undo" the installation, so to speak, and start again?

Thank you in advance.

Best regards,
Joe

From: jpcurtinae7ld
Topic: 1212 Message: 1219

Hi, Robin!
I re-installed the latest drivers (again), and seemed to be in the same loop. I again tried different USB ports, which was recommended else on this user group. Specifically, I have three USB ports. One was in use for a wireless mouse and I switched back and forth between the two available USB ports. Still no luck. Lastly, I switched the wireless mouse to one of the other two USB ports and plugged the DV-AP Dongle into the USB port that was previously in use for the wireless mouse. To make a long story shorter, everything worked fine after that. I restored the wireless mouse back to the its initial USB port and tried the DV-AP Dongle on the two remaining USB ports. Everything worked fine. After all of these years in using a Microsoft-based operating system, I am still remarkably impressed as to how Windows can be self-modifying and then later heal.

Thank you for your help. I can now turn to learning how to operate the DV-AP Dongle.

Best regards,
Joe

Hi, Leanne!
I re-installed the latest drivers (again) per advise provided elsewhere on this user group, and seemed to be in the same loop. I again tried different USB ports, as you suggested. Specifically, I have three USB ports. One was in use for a wireless mouse and I switched back and forth between the two available USB ports. Still no luck. Lastly, I switched the wireless mouse to one of the other two USB ports and plugged the DV-AP Dongle into the USB port that was previously in use for the wireless mouse. To make a long story shorter, everything worked fine after that. I restored the wireless mouse back to the its initial USB port and tried the DV-AP Dongle on the two remaining USB ports. Everything worked fine. After all of these years in using a Microsoft-based operating system, I am still remarkably impressed as to how Windows can be self-modifying and then later heal.

Thank you for your help. I can now turn to learning how to operate the DV-AP Dongle.

Best regards,
Joe

Wow, I am impressed too!
You re-installed the drivers, swapped USB connections and did the necessary to restore everything to its initial USB port...
And YOU still think Windows is smart? ;-)

Topic: 1223 Message: 1223

Hi Robin & the Group,

Just received my DVAP and having a great time with it.
Thanks Robin for a great device, keep up the development work....

Being a Linux fan, I have run up my DVAPTool under a number of Linux OS's.
And on my old DELL Laptop running Linux Debian 6.

In almost all instances I have come up with the problem of "unable to access the USB port".
This is a common situation with Linux and comes from the rather severe adherence to "permissions" in the Linux System. That is each "user" must, in this case, change the "permission" to use the ttyusb0 device.

This is done quite easily as "Super User", go to /etc and edit the file "group".
Make this change:-

dialout:x:20:(add your user name here) save, and reboot.

You will find dialout near the top of the list.

After doing this AND removing (brltty & Modem Manager) the DVAPTool will start up every time

Have fun

Gordon
ZL2ARN

ps D-Star DV ZL2VH will be going on line very soon.

Hi ???. You didn't provide a name nor callsign so I can't look through the logs to try to find out what is going on. The most common cause of your issue is using a letter in the eighth position of your callsign that is not registered.

Hi,
if you have installed the DVAPTool on the default location (that would be /Applications), then your recording will be located in there.
I just got my DVAP and tried the recording function, and found the file was in there.
I believe you will get a single *.dvrec file containing all the streams related all QSOs that where available at that time (so not a file for each transmission like with DVAR HotSpot).

If you have installed your DVAPTool somewhere else, then I believe the recording file will be located exactly where you have installed the APP; in such case you can use spotlight and search for dvrec and you will find it.

Hi Cory. Your callsign is not registered. Is it possible that someone deleted your registration?

You'll need to re-register. Take a look at the instructions at http://www.dstargateway.org/

From: Andrew T
Topic: 1233 Message: 1233

Dear All,

Has anyone managed to have both the DVAP (red) and the DV Dongle (blue) running at the same time or plugged into the same computer.

I need to disconnect one or the other to have the other one working. If both connected they are showing different COM ports (9 & 11) on my computer but cannot seem to start the DVAP or have this working.

I would really like to use both at the same time on the same computer (with different IDs). This way I can listen when in the shack to 2 different reflectors or repeaters.

Operating system is Windows XP SP3.

Andrew

Hi Andrew. I've seen this done by others and have done it myself. You just have to pick the right com port in each of DVTool/DVAPTool.

1236. DVAP not found Windows XP

Yahoo group: DVAPDongle
Date: 2011-11-04 17:47:04 UTC
From: Zach
Topic: 1236 Message: 1236

Hi

first off i would like to say i have been able to get the DVAP working the way its supposed to in the past without a problem. However recently when i needed to reinstall Windows, I have encountered a problem. I installed the USB driver as usual, and that went fine, the Dvap's green light pulsed, and the driver was reported to been functioning right, according to device manager. However when i start Dvtools 1.2, the program informs me that it can't find the DVAP,and therefore won't bring the grey dialog box up. I have not run into this issue before and am a little stumped on where to proceed next in the troubleshooting - Otherwise it has worked great in Win 7, and Xp, before recently. Great product! Keep up the good work and R&D.

Thanks

Hi Zach. You might try to download the latest FTDI drivers from www.ftdichip.com. Look for the VCP drivers for windows. Also, make sure the DVAP is plugged in before starting DVAPTool.

If things still do not work, try downloading the batch file:

http://opendstar.org/tools/ftdireg.bat

and run it. Send the output back for analysis.

Thanks,
Robin

1238. DVAP Problem

Yahoo group: DVAPDongle
Date: 2011-11-22 18:22:31 UTC
From: Gil
Topic: 1238 Message: 1238

I've had my DVAP for 9 months or so. I got it when our local D-Star repeater was not on the air yet, but the pc controller for it was in use at the trustee's houme, so I could link to its call sign via the DVAP and use my IC-92. It all worked just fine.

The repeater finally got on the air and I put the DVAP aside. The repeater is now out of service again and I dug out the DVAP, but I don't seem to be able to get it working again. I don't think the local repeater's control pc is up and running, so I've even tried linking to reflectors, but without success. My radio talks to the DVAP. The screen says "Devie Opened". The green light blinks when the DVAP is first connected to the USB port, the blue light blinks when the program is running, and the green light comes on steady when it's receiving. It hasn't done any transmitting so I don't remember what's supposed to happen with the lights for that. The device manager (Win7) says it's really connected to COM4. The DVAP software says it's all up to date.

Back when it was working, I had programmed the DVAP linking function for the local repeater call sign into the IC-92's memory for the simplex frequency I've always used with the DVAP. Since there was the remote possibility that the pc for the repeater had been retrieved from the site and set again as a stand alone D-Star pc (using the repeater's call sign, but just without the actual repeater), I tried that link and the DVAP actually said it was "unknown" which tells me that the repeater controller pc is not in use - which is quite likely true. That happened exactly once and I could not repeat it. Anything else I do, including trying (UR=)"DVAP I" (the "I" is in the eighth position...)results in only the signal strength meter showing that the DVAP radio is receiving. The same for (UR=)"REF030CL".

I've got the right simplex frequency in the radio; the radio is in DV mode; I've got MYCALL set to WB2UTI as it always has been; I've got no entries in R1 or R2. I just can't get the DVAP to respond.

There's probably something really simple or stupid that I'm just not seeing right now, but I'm getting quite puzzled by this and I was hoping someone could see the obvious thing I've overlooked. My guess is that it's something in the radio that I've not set up right. I'll confess that this radio still intimidates me somewhat, but I thought I had at least this much figured out already.

Any words of wisdom would be appreciated.

Gil, WB2UTI

1239. DVAP Problem Update...

Yahoo group: DVAPDongle
Date: 2011-11-22 19:00:01 UTC
From: Gil
Topic: 1239 Message: 1239

For some reason that I can't explain, after about the tenth time of unplugging it and trying different USB ports and finally coming back to the original one, I am now getting responses from my DVAP. The red led lights up as it responds. However, it seems to say "DV Access Point Dongle" no matter what I send to it. I've tried "DVAP I" and "REF030CL" with only that same response. It does record and play back my voice.

When I send the request to link to Reflector 30C the radio displays "Not Linked" to confirm what the DVAP is telling me. (Well, the DVAP is only saying DV Access Point Dongle", not that I'm linked or not...)

I do have an internet connection. What else am I missing here?

1241. Re: [DVAPDongle] DVAP Problem

Yahoo group: DVAPDongle
Date: 2011-11-22 20:14:38 UTC
From: Matt Maguire
Topic: 1238 Message: 1241

So, when you send something to the DVAP, and go back to receive, you see the signal meter on your radio react? Do you see a red transmitting LED on the DVAP to indicate it is sending something.

Sounds like it could be something silly like tone squelch or callsign squelch set on your radio.

BTW, your registration still looks ok.

Robin, thanks for replying. It doesn't get any better than that.

The DVAP is showing "DVAP I" as if I had interrogated it for information, so I guess it's giving the right answer. As far as I can tell, the radio was not transmitting that request. The display on the radio was showing the request to link to the reflector.

I should mention that the latest development is that I tried and supposedly succeeded in updating the device drivers according to some other posts here. Now I'm back to not hearing anything from the DVAP again and the COM port changed from 4 to 7 although the DVAP still indicates it's talking to the pc OK and the signal strength meter still indicates that it's receiving the radio transmissions, but not reacting to them.

And to respond to the other reply, on those occasions when I do get a response from the DVAP, yes, the red DVAP led lights up - it does transmit when it decides to do so and the radio talks to me with Robin's announcements.

Hmm, the device should not have changed after updating the drivers. Does more than one com port show in the device list? If so, select the other com port.

If the only thing that shows up in DVAPTool for urcall is "DVAP I", then it is either a programming issue with the radio, a noise issue that is keeping the header from making it to DVAPTool intact, a power issue (unlikely but make sure your power level is at its lowest level), or a frequency match issue.

From: Gil
Topic: 1239 Message: 1244

Well, the reports of my successful recovery may be a little premature...

There's still something out of whack with my situation. Once again I deleted the registry entry for the program and ran it again with the defaults. It offered me only COM7 and I entered my call sign. I tuned the radio to 146.55 and keyed up with UR=REF030CL. It connected nicely.

I changed the program frequency to 147570000 and the radio frequency to 147.570 and tried to unlink. It wouldn't do it. I changed back to 146.55 and it worked. I gets my call sign right in the MY field and it says it's listening to WB2UTI, but it just doesn't pay attention to what I'm asking it to do. It only seems to remember the last thing I asked it to do on the default frequency.

If I ask it to try to connect to (UR=)W4VLG BL when the frequency is set to 146.55 it responds with "Gateway Unknown" as it should because that system is presently inoperative. If I then close the connection and change the frequency to 14757000, and try to link to Reflector 30C (and I see it on the radio's display - it's really sending that as "UR"), it still tells me "Gateway Unknown" and the UR on the computer screen still says WB4VLG BL when I key up (and the computer display says the program is listening to WB2UTI). If I send the unlink command it still says the same thing. But if I change back to the default frequency, and then send the same UR for the reflector, it immediately links to Reflector 30C.

As far as I can tell, the DVAP radio is tuning to the desired frequency. It appears to receive me there and it talks back to me there. It just doesn't do what I think I'm properly asking it to do when it's tuned to 147.57.

I guess the simple solution is just to use it on the default frequency (I haven't tried others yet besides the one I wanted to use but I never had any trouble doing that before (months ago).

I'm still puzzled...

From: matt e
Topic: 1245 Message: 1245

Hello Group!

Please forgive me if this has been discussed before. I have multiple Android devices(Phones and Tablets). Is there any way to run the DVAP through the USB port? Are there any DVAP tool apps for Android etc?

Man would it be nice to run my DVAP through my cell phone or Galaxy Tab Plus! Talk about a portable setup!

Thanks!

Matt

Hi Matt,

I was thinking about this today as well. I'm not sure how the DVAP Dongle would connect to the Android device if it doesn't have a "host" USB connector. How many Android phones have both host and device USB connectors? Can a device USB connector be pressed into service as a host? I would imagine a special cable would be needed.

Regardless, I agree that an Android + DVAP DOngle or DV Hot Spot would be a killer device... instant and extremely D-Star comms anywhere you have cell phone coverage.

Michael.

Hi Guys. The android tablets have USB OTG (on the go) ports which can act as devices or hosts. I've plugged a dongle into a Motorola Xoom and it powered up. The android 3.X release has support for USB host functionality so it is just a matter of writing the code. :)

Interestingly, I plugged a dongle into a Samsung Galaxy S II and it powered up. There is hope for phones as well.

OTG mode is not equivalent to host mode (only a certain limited selection
of peripherals types are supported when a port is in OTG mode, like
keyboards). While recent Android software releases do support host mode,
most current tablet hardware does not, so it's a moot point on the current
crop of tablets (same with phones). Turning an OTG or peripheral port
into a host port is not just a matter of software.

Unfortunately, powering a peripheral and actually communicating with it are
two different things. I don't doubt that there will come a time when usb
host mode is possible on mobile devices, but it's not quite here.

Actually, my android based Motorola Xoom tablet will power and talk with the DV Dongle/DVAP just fine. Most of the honeycomb based android tablets will.

ARE YOU KIDDING??? Please confirm ... you are using your DVAP and/or Dongle with/through the Motorola Xoom tablet? Some here have said they couldn't (???)

I'll seriously consider picking one up now if you and others can confirm its possible, I've been looking for a convenient way to run a DVAP in the car without having to lug a laptop with me for that purpose.

Eagerly waiting some replies. BTW, IF you can use it with the Xoom, is there anything special required or do you just plug the DVAP/Dongle in it and you're ready to go?

I have a dual boot 10.1 Viewsonic tablet with two 'real' USB 2 sockets, they power and work with a portable DVD burner fine (one power, the other power and data). It has a Sim card socket for any network too.
Its quite likely it will work with the Dongle or DVAP (on the Windows 7 side), but, the cellular part won't. Cellular does on the Android side however, typical!

I would tether the other Android phone to the tablet (with PDA.NET), but the mobile phone service over here is abysmal, you have trouble keeping a voice convo going, let alone data most of the time.

Maybe, if Robin could design a DVAP with a built in rechargeable battery, cellular broadband dongle and client software into one package, that would solve all our problems ;-)
(Only kidding Robin!)

Neil G7EBY.

Ah ... now you've got me interested. I need to check out the HP Touchpads
that I picked up a couple of months ago on fire sale (when HP got out of the
tablet business). They're running Cyanogenmod CM7 Alpha which works really
well ...

Hello Neil,

Perhaps a dongle with a Wifi connection..... My Android offers a
Wifi hotspot connection to 3G, would solve a lot of problems.

From: SCOTT
Topic: 1256 Message: 1256

is their any new firmware /software planed this year for the dvap with any new features its amazing peace of kit
thanks

1257. My audio is reported as breaking up or fading in/out

Yahoo group: DVAPDongle
Date: 2011-12-01 11:47:44 UTC
From: grantjfleming
Topic: 1257 Message: 1257

First time DVAP user. I can receive stations on all reflectors etc ok. My audio is always reported as breaking up or fading in and out. My internet connection is a fast wireless so I can't see a problem there. The yellow LED on the device does not flash to show that I'm experiencing any packet loss.
Could my device be a little off frequency? I have tried shifting it a little each way as per set-up advice but still no good. My IC-92AD is working fine when connecting direct to D-Star network.

Any advice?

Thanks, Grant VK2HHC

Hi Grant. If you try a long echo test, that will rule out frequency issues. Wireless connections are often the issue. Can you try a wired connection to rule it out?

From: grantjfleming
Topic: 1257 Message: 1260

Hi Robin - great to get the reply from the man himself!

A long echo test performed well.
I must now try to find someone with a wired internet connection - this is difficult as everyone I know uses wireless internet these days! My wireless internet is usually at 54Mbps. In what way do you mean wireless connections are often the issue? Are you refering to interfering signals with the dongle?

A little more info to help with fault-finding:
My audio is reported NOT sounding like packet loss (R2D2), but more like broken speech like letting go of the PTT and sounding like having hickups! Sometimes my audio is reported much better than other times.
I have lowered my IC-92AD power to 100mW but regardless of power setting there is no improvement.

Thanks for all your help.

From: joen7xxx
Topic: 1261 Message: 1261

I just tried to use my DVAP after a month or so of non-use. When I hit the open button, i get a "no gateway found check your internet connection" message. I just got a new dsl/wifi router and have been having port forwarding issues with my IRLP node. Might there be a connection, (

Joe - N7JEHor disconnection) here?

Thanks folks!

From: joen7xxx
Topic: 1262 Message: 1262

I've had my DVAP for quite a while now and have had no problems. I tried to use it today and when I hit the connect button, I get a message saying it cannot find a gateway. The green led is flashing. I did get a new DSL /wireless router from my provider. I have internet connectivity but have had port forwarding problems with my IRLP node. Maybe a port forwarding issue?

Any help is appreciated.

Topic: 1257 Message: 1263

Hi Grant. Wireless connections usually have some degree of packet loss. You don't typically notice it since most applications use TCP connections that resend lost packets. VOIP type apps like D-Star use UDP so that there is minimal latency between packets. UDP packets are not resent when lost. As a result, if you have a problematic wireless connection, you will notice more issues with UDP based apps. The symptoms are choppy audio, not R2D2. This sounds like the problem you are experiencing.

Try the hardwired link if you can. You might also try a different wireless link if possible.

Hi Joe. That is usually an internet connectivity issue. If you cannot connect to the name server to get the list, it will give you that message. Try browsing the web to make sure you have a good connection and then retry the "Open" button.

I had the same problem Friday evening. I was able to connect to Reflector 1C and a one local repeater, but not to several other repeaters. Not sure what was happening. Need to try again this evening.

My web connectivity seems to be fine. Since installing the new DSL router/modem I have had issues with the DVAP, SKYPE and my IRLP node.

Years back when I got into VoIP QOS statistics it was a real mess. Most products on the market ran their numbers as a man in the middle. A Packet sniffer. I said "the endpoints could do this so much better". It is 2011 and sniffing is old hat now in that industry. Everyone is supporting RTCP and the PBX systems are now delivering those statistics to monitoring and reporting applications.

http://en.wikipedia.org/wiki/RTP_Control_Protocol

The dongle software and d-plus are the end points and can know best when packet delivery is causing problems. If the dvap dongle software was to send notice to the user of a problem then that user will slowly see a pattern develop and can solve these network issues.

Maybe they see patterns at night. Maybe they see them when Windows does an update.

There are ideas out there that can solve these problems so that this user does not get a poor quality report from other users. The software provides that.

Another concept that may be nice is a concept of a 'D-Channel'. Since we are not dealing with T1/E1s here we'll rename this to a control channel over TCP. Quality stats as well as connection data can be streamed over this channel.

Both these concepts will create additional load on the server (d-plus), but I think if we are looking to walk down the path of Android something does need to be done to provide a quality stream to network for the benefit of the OTHER users. Part of this requires pro-actively telling the offending user that there are issues in their network.

I tried mine again last night and got the "No Gateway Found" message on several local and out of state repeaters. However connected to Reflector 1C just fine.

Not sure what is going on unless the repeaters that I am connecting to have internet issues themselves.

Hi Mike. We did notice some flakyness with hosts on the bellsouth (AT&T) network. It impacted several hosts connected to REF030. It seems that it was a short lived issue though.

Thanks for the tip Robin,

It might explain also that for the past few days I had an error message when starting DVAP Tool saying it can't get the gateway list and tells to check the Internet connexion. The Internet was othewise working fine, but the common point with this thread is that I was on a Bellsouth (AT&T) connexion when it happened.

I received an email from the local repeater owner about my problem of connecting. It appears that there is an issue at the repeater site that won't allow an inbound connection. He said that he would look into it later in the week.

One mystery solved...

hello
I plan to buy another dstar radio soon, i wasnt impressed the last time.
I also plan to possibly get a DVAP thing, NOT the other one, the blue one.

Question
Can the DVAP be heard on the audio speaker system on a computer, or does it have to a radio to TX to so to hear the audio on RF only?
Or do I have to have radio to hear the DVAP output?
i am not concerned with txing at the moment, for which I know i must have a radio to0 use the DVAP.

Hi Patrick. The DV Dongle (the blue one) has an AMBE chip so the PC can encode/decode dstar audio. The DV Access Point Dongle (the red one) replaces the AMBE with an RF modem chip. As a result you cannot use one for the other.

Blue = PC speaker/mic
Red = dstar radio

1277. Icons for DVAP tool

Yahoo group: DVAPDongle
Date: 2011-12-14 01:14:19 UTC
From: bigevilcorp
Topic: 1277 Message: 1277

for those of you who enjoy colorful icons like myself find below some links to icons I made for the DVAP tool (its just a image of the DVAP converted to icon format)

Here's what they look like typically

http://i221.photobucket.com/albums/dd299/BigEvilCorp/misc%20forum%20linkage/bc3d4942.jpg

the link below contains a zip with (2) folders, one with the DVAP Tool and the other with the DV Dongle tool icons (they're Mac OS folders). All you do is control+click the folder, click "get info" then click on the icon and command+c (that copies the icon). After that find your DVAP tool in your applications folder, control+click, select get info, click the current icon and hit command+v (that should paste the icon)

youll have a pretty little icon to accompany your DVAPing....

Here's the link. Enjoy!

Hello,
yesterday i started for the first time with my new dvap dongle. It worked fine. But today i get (without changing anything) this message...
How can i check if the IP-adress is online to which the dvap checks the internet connection?
The internet connection works properly with all other apps.

1280. CALL SIGN w/ "A" showing on REPEATER

Yahoo group: DVAPDongle
Date: 2011-12-24 02:56:20 UTC
From: KB8VAO
Topic: 1280 Message: 1280

Hello Group,
I set up my DVAP Dongle, and Registered on D-Star through the K3AWS Repeater. According to the directions I found, I typed my call sign into DVAP Tool with a space and then "A". In the directions I found, it said the "A" would not show up, but I see it when I check the "LAST HEARD on K3AWS". If I remove the "A", the system will say Connected, "RECEIVE ONLY". Can someone Please tell me how I can remove the "A"? I see other calls listed without the letter. I've searched around, but can't find info on this. Probably not looking in the right place, but I'm new at D-Star. Any help would be greatly appreciated. Looking forward to chatting with many of you in the future. Any hints or tricks, to help a newbie would be greatly appreciated. Got the Nifty EZ Guide, but just haven't had time to sit down and read the whole thing.
Thank You in Advance.

just log into the repeater where you registered (K3AWS) and create a second terminal entry, where the "initial" field is set to a "space" character (you must physically type the space character into the box).

If you try to use a different repeater, you may need to wait some time for this change t propagate throughout the network.

Robin has suggested that "A" be used so people know you are on a DVAP and can't be call sign routed to.

From: KB8VAO
Topic: 1280 Message: 1284

Thank You for the help. I tried it, but when I log in the system replies with "RECEIVE ONLY". So I've asked the repeater owner to delete me from the system, and I will try to register again, without the "A". 73, Steve KB8VAO

1285. "Receive only"...

Yahoo group: DVAPDongle
Date: 2011-12-24 15:49:33 UTC
From: Cory
Topic: 1285 Message: 1285

Happy Holidays to the group,

I'm sure that this topic has been brought up ad nauseum, but I do need to bring it up once more, as I couldn't find any posts that worked for my situation.

I've had my DVAP for about a year now, and it's worked flawlessly up until a couple months ago. Once day when I fired it up and it connected me with "receive only"...I didn't do anything different that time, and it has been this way ever since.

I understand that this is a common issue, one that I hope has a rather simple solution. If anyone could help me with this, I would really be grateful.

Wishing everyone and their families the very best this holiday season.

73,

Cory T. Spankowski, NREMT-P, CCP

Hi Cory. It doesn't look like your callsign is registered. To transmit, you'll need to follow the instructions at http://www.dstargateway.org/. Perhaps you were deleted from the gateway where you registered before?

From: Kenneth
Topic: 1280 Message: 1287

you need both one with the A at the end for your dvap. And the one without the A for your radio.

that is the correct way to setup it up. you just need to setup a terminal with out the A on the gateway
you registered on.

ken n1dot

that is the way i run mine with dvaptool.

Don't do that, just create a new terminal entry in your existing registration like you did the first time, but for this entry use a ' ' (space) character instead of an 'A'

Robin I have spoken to you in the past. I was registered on both w4aes and ka4res. At my request I was deleted from w4aes last Sunday. Since then I can't get on using my dongle. I get message linked but receive only. I checked my registration on ka4res and realized had not listed radios. I made 2 entries for my 92 ad and dongle using the letters R & V respectfully. Still get the same message. Have tried my call sign only, with a A and a V without success on the DVAP screen. Do you have any suggestions. Tnx

Hi George. Until you complete the instructions as listed at www.dstargateway.org (by creating a "space" terminal), you will have to use the letters you register.

Hi Brad. Your callsign is registered but you don't have any terminals registered. Take a look at the instructions at http://www.dstargateway.org for adding a terminal.

Note that a terminal of "space" allows you to use "W0TVS" and adding a terminal of "A" lets you use "W0TVS A".

1295. Windows 7 64

Yahoo group: DVAPDongle
Date: 2011-12-26 01:16:08 UTC
From: k4fh
Topic: 1295 Message: 1295

Normally I use Linux with the DVAP. Today I tried my parent's Pc with is a HP Windows 7 64 bit. This is a HP TouchSmart. The computer and LCD are made as one. When I plugged in the DVAP the LEDs flashed briefly and the computer immediately made the sound of unsucessful detection. This is not the normal "Installing.." then a prompt for drivers. This is as if it tried, but failed to detect anything. I then fired up my netbook and it worked fine.

Has anyone else experienced this?

1306. Re: My audio is reported as breaking up or fading in/out

Yahoo group: DVAPDongle
Date: 2011-12-28 10:52:38 UTC
From: grantjfleming
Topic: 1257 Message: 1306

Hi again Robin & the group.

Well, after being back at my home QTH for a week I have found that my DVAP audio is always reported as fine now, issue solved!

I am using the same internet wireless modem as always. The only difference would have probably been in the quality (or lack of quality) of my internet wireless connection while I was travelling. My home QTH apparently achieves a good data transfer wirelessly.

As I stated before, this wireless modem has no problems surfing the net and downloading at a good speed while I am travelling. But as you say - maybe not always good enough in some locations for a 'real-time' application like D-Star.

Thanks again for all your help.

VOIP type apps like D-Star use UDP so that there is minimal latency between packets. UDP packets are not resent when lost. As a result, if you have a problematic wireless connection, you will notice more issues with UDP based apps. The symptoms are choppy audio, not R2D2. This sounds like the problem you are experiencing.

Hi. You have registered a "space" terminal but are using an "A" as the eighth character of mycall. Either change the "A" to a space or register an "A" terminal as well.

The eighth character of mycall must match a registered terminal (initial).

I believe that what you are asking for is already there.

Currently if I am sending GPS-A positions, they will get sent to aprs.fi. On APRS.fi, you will see your position AND it will show the distance to the "digi" which in D-STAR is the repeater (module and often frequency) that your friend's signal was heard on. Connect to the repeater and there he is.

And of course call sign routing should also work, without know his location.

I'm new to this group so please forgive me if this isn't appropriate, but there may be another fix for this (workaround). I'm not familiar with APRS, but isn't there a way to put a small message in your APRS transmission? I thought in the many briefings I've been in...that you could put a message in there. The message could be "hanging out on ref001a" and people would know where to go look for you.

yes you could do that but their is load of reflectors and you would have to go into your menu system all the time and change it to ware you are the way it would be good if it worked if you were on ref010c and you keyed your mic the software would put it on the aprs map in the status message part that your on ref010c then if you moved to ref001a and keyed the mic it would do the same and so on it might no be able to be done but it just a idea but the dvaptool currently do sent support gps/aprs

1316. A bad idea?

Yahoo group: DVAPDongle
Date: 2012-01-08 13:13:36 UTC
From: blairs_viper2008
Topic: 1316 Message: 1316

hello
I am just floating the idea of using advap dongle as a hotpsot for
DV (dstar). I was thinking about the possibility of amplifying the RF
to maybe 10 watts ERP, as allowed in the uk. Of course I understand the dongle was never
designed or intended to be used in that way.
I have concerns about the spectrual purity and harmonics etc when increasing the output
using an amplifier. Of course the other factors need thinking about, such as overloading
the dongles reciever amongst other things. it isd omly an idea. it is a lot less
aggravation than building a potentially unreliable GMSK node.

(Of course in the UK i will need an NOV, and OFCOM are currently NOT permitting GMSK nodes
in the UK on 2 meters).

Any opinions on this, especially from Robin?

From: kk4clf_shawn
Topic: 1317 Message: 1317

I have owned my DVAP for almost a year with no problems. I have had it running under Windows as well as Ubuntu.

Now when I try to connect to my DVAP (in my normal Windows OS), my radio flashes the "DV" indicator and I get a message that says "FM DET". I have no idea what this is.

The only thing strange that has happened lately happened last night. I was reinstalling Ubuntu, and when I set up the printer it thought the DVAP was the printer. When this happened, it started printing the test page to the DVAP. Could this cause an issue with the DVAP?

Thank you for any help,
Shawn

fm detect usually means the radio is detecting a non-digital signal on that frequency. try a different frequency.

Topic: 1319 Message: 1320

Hi Bradley. If you plug in the DVAP and it slowly pulses green, you may have the drivers already in place. Run DVAPTool and see if it shows the device.

If not, you can extract the CDM zip file to a folder and manually run the new hardware wizard. You can do that by right clicking on "Computer" icon on your desktop and selecting "Properties", then look for the devices section. You can right click on the uninstalled USB device and do a driver update from there.

If you have problems with this, send me an email directly and I will walk you through it.

You didn't say which radio you're using, but FM detect on the IC-80AD can be turned on or off. It may be completely unrelated to the issue you described. Check that feature on your radio.

PK,

You are correct in being concerned with the spectral purity, this is in effect a low power data transceiver, not designed to be amplified as it is already within tolerances set by the EU. Amplify it and the tolerances simply fly out the window, unless you are up or building a super Hi-Q filter to notch out anything but the frequency you want to use, then you would need a microWatt amp to up the power to something you can amplify more, I'd forget it if I were you :-)

Anyway, what's wrong with the cheaper German board (sorry Robin, a bit OT..) which is less than a bottle of decent Scotch, combined with a cheap S/H ex PMR rig for £5 at a junk sale and that will do 5W happily all day.

Also, where did you hear about the NoV's for VHF hotspots being stopped? Maybe you mean UHF, but they are as long as in attended mode, if you want one this decade. As far as I know, VHF is still OK for attended or unattended.

I would save your DVAP for home, holiday or showing it off to friends, its a really decent bit of kit in a small package :-)
I.E. don't ruin it!

Neil G7EBY.

I tried looking threw the manual, and everything I read says that the ic-92ad is receiving a non-digital signal. Could Ubuntu have damaged the DVAP when it thought that it was a printer, and sent a test print page to it?

From: Tim Hardy AF1G
Topic: 1317 Message: 1326

I'm at a loss to imagine how damaging your DVAP could generate the FM signal you are picking up on your handheld. The best person to direct your original question to is Robin, AA4RC, the developer of the DVAP.

Do you see the FM Det when the DVAP is not transmitting or when it is transmitting? Do you see the FM Det when you're not using the DVAP at all? Do you see the FM Det when the DVAP is unplugged from the computer and not powerred?

I also use a DVAP, and when I first chose my operating frequency, I noticed a lot of FM Det on my IC-80AD handheld from spurious household signals. It wasn't causing any problem that I could tell, but I searched for another frequency where I did not see the FM Det activate and changed the DVAP's operating freq to that.

There are many items in the typical household (and office) that generate signals that cause my radio to see FM Det on certain frequencies. Any computer chip-based product may generate surious signals - your desktop or laptop computer, TVs, clock radios, you name it -- they are all over the house. Try changing your DVAP operating frequency and see if the problem goes away.

From: aa4rc
Topic: 1317 Message: 1328

Hi Shawn. There have been many good responses here. One thing to note: If you open the DVAP in DVAPTool and key up in dstar mode on your 92, does your callsign show up? If so, it is in dstar mode and should not generate FM.

If you feel your DVAP is damaged, send me an email and you can send it in for a diagnostic test.

Shawn,

I would recommend turning off the Auto-DV detect and listening to the signal as a DV only channel and then listen to it as FM.

Is there another D-STAR radio, from maybe a fellow ham, available to listen to the signal? Can your radio hear the Madison or Huntsville repeaters ok?

While it might be a slightly long trek, one option would be to bring it over to the GARS Techfest this weekend (http://www.gars.org/joomla/index.php) and let us take a look at it. I believe that Robin may be there as well.

I know that just making the trek for your DVAP would be a little long, but there's a log of other things going on that may be of interest to you and others if you want to put a carpool together. Techfest is in Lawrenceville GA, about 30 miles NE of Atlanta.

From: kk4clf_shawn
Topic: 1317 Message: 1330

I am not sure if my last message went threw, but i did try to re-flash the firmware. That did not work either. I am still not getting anything to my radio. If I manually break the squelch, I do hear R2D2. Even though the RX signal meter is showing full strength signal from the DVAP, it is not getting threw as DV.

1333. Re: [DVAPDongle] Re: DVAP issue

Yahoo group: DVAPDongle
Date: 2012-01-12 00:50:46 UTC
From: Shawn Borden
Topic: 1317 Message: 1333

OK, let me try to answer some of these questions. I posted a reply to most of these messages yesterday, but I guess it did not go threw. I think yahoo groups have been acting flaky as of late.

Fran wrote: "Are you close to you internet modem or router when you see this?"

Not necessarily. I have tried it next to my computer, in the living room, and out in the middle of my front yard. It really does not matter where I am at.

Tim wrote:"Do you see the FM Det when the DVAP is not transmitting or when it is transmitting?"

I am getting the problem only when the DVAP is transmitting, and at no other time. When it transmits I will either get the FM Det or nothing at all. My 92ad will show a full strength signal being transmitted, but the signal does not break the squelch to my radio. I believe this is because it is transmitting the reply from the DVAP either in FM and not in DV or garbled DV. More on this further on.

Derek wrote: "How about trying a power on reset?"

I did try the warm reset as well as the full cold reset to factory defaults on my radio. Neither approach has helped. After I reset to factory defaults, I downloaded a known good program with memories and general settings back to my radio via my RT systems software. Same problem still occurs.

Robin asked: "One thing to note: If you open the DVAP in DVAPTool and key up in dstar mode on your 92, does your callsign show up?"

When I key up my radio, the DVAPtool software does register my callsign, and whatever action I am taking. When I try an info command, DVAPtool shows the input. It then, in turn, transmits "something" that I can not receive on my radio. When I ask it to link to a reflector, it does so, then any incoming calls I see either as FM Det with no sound, or a full strength signal from the DVAP that does not break the squelch. I am not sure if this is because it is not seen as a DV signal or not.

ED wrote: "I would recommend turning off the Auto-DV detect and listening to the signal as a DV only channel and then listen to it as FM."

I have not turned Auto-DV off yet, and I will test that, but if I manually break the squelch, I hear a R2D2 signal. I have tried several commands all with the the R2D2, but only if I break the squelch. The signal from the DVAP does not break the squelch. Just for note, the squelch on the radio is

set to Auto and I have no problem with it with any other mode.

I had the opportunity to test my radio yesterday with the KI4PPF Huntsville repeater yesterday after work. I live just barely outside of the range of this repeater. I got an immediate reply to my request for a radio check. I was told that it had a great signal into the repeater without any issues at all. So it would seem that the radio is functioning properly. I did try to re-flash the firmware in the DVAP without any success.

As far as I can remember, that is the full update. I do not think I have left anything out.

A huge thank you to all you guys trying too help me threw this issue. All suggestion are welcome and appreciated.

Hi Shawn. One other thing you might try is to vary the frequency you enter in DVAPTool +/- 5Khz to see if there is a frequency issue.

Feel free to email me directly if you'd like to send the DVAP in for testing. If there is a problem with the DVAP, we'll be happy to fix or replace it.

1335. Re: [DVAPDongle] Re: DVAP issue

Yahoo group: DVAPDongle
Date: 2012-01-12 18:01:57 UTC
From: BEDFORD NEIL
Topic: 1317 Message: 1335

This is a rather odd fault I must admit, it almost sounds like its inverted the TX data.

Can you listen in to the DVAP with an anlog radio, then compare the signal from your HT? If they sound the same, maybe its time to send it back to Robin.
However, would it be possible to re-upload the firmware to the DVAP I wonder (Robin)? IF the printer has corrupted something, it might just be the answer....

Cheers,

Neil G7EBY.

Hi all. A firmware update should never be needed. If the firmware is corrupted, you probably won't be able to update it since the update happens in the firmware. :)

The Icom 2820 is the only radio I've heard of that will crossband dstar properly.

I have used the Alinco DR-635T, as a cross band passing D-Star.

Works well...

Hello
I am sure tehse questions have ben answered before some where?

I have just bought a dvap, I have an ic92.
I have installed what I think are all the dvap files.
I have a green flaashing light.
What axactly am i supposed to be seeing on the computer which I am not?
Should I be seeing long list of reflectors or stuff which I am not?

Hello
thanx for replying robin
Yes i have read it, yes i used the dvtools and dvfm
both radio and dvap dongle talk to each other perfectly.

My problems are on the radio side, setting all that stuff up, UR call, my call etc. REALLY confusing!

Anyway what i was hoping to see was list of reflectors on air via the dvap on the computer. It will be very akward to figure out what is on/off air.I have had to go all over the net to many places to see what is on and off. i think your dv dongle can do that. I think possible the radio can, but just seeing ref001ccc on the screen tells me NOTHING!
This may be the wrong group for radio setup.

Hi PK. Valid points. I'll look at adding a gateway/reflector list to DVAPTool.

If you are looking for busy reflectors, REF001 module C is probably the most popular. REF030 and REF014 are also quite busy at times.

PK,

Just put REF001CL in the UR field and kerchunk. This should cause the DVAP to link to REF001C. Before talking, switch back to CQCQCQ in the UR field.
To unlink, UR: ▪▪▪▪▪▪▪U where "▪" represents a space

The DVAP is basically totally controlled by your radio. You do not need, nor can you really use the keyboard to do anything.

Subject: [DVAPDongle] maybe i ask the wrong question

Hello
thanx for replying robin
Yes i have read it, yes i used the dvtools and dvfm
both radio and dvap dongle talk to each other perfectly.

My problems are on the radio side, setting all that stuff up, UR call, my call etc. REALLY confusing!

Anyway what i was hoping to see was list of reflectors on air via the dvap on the computer. It will be very akward to figure out what is on/off air.I have had to go all over the net to many places to see what is on and off. i think your dv dongle can do that. I think possible the radio can, but just seeing ref001ccc on the screen tells me NOTHING!
This may be the wrong group for radio setup.

In the standard memories, create a number of entries for your DVAP, one for CQCQCQ, one for Status, one for Echo. One for Unlink and one for each of the repeaters/reflectors that you want to link to. Then all you need to do is to switch channels for each function.

Once you are happy with that, many put assign them to a specific bank and then use the banks to switch between groups of memories, which is often switching between repeaters.

Maybe something like:

Just always make sure you switch back to memory 0 to talk.

Patrick,

The RPT1 and 2 are only used by the local repeater or node to validate you are wanting to use that repeater (not another one on the same frequency), then if you want to use it for local or gateway QSO's, or, talk between modules (frequency's/bands) on the same 'stack' (pile of different band repeaters hi).

The chances of someone owning a DVAP near you and using it on the same frequency, is quite remote, so the RPT settings are not needed.

The 92 is actually a better radio to use than some, all you have to do is hit menu, go fully clockwise to 'callsign', hit 5 (enter) then scroll clockwise through the callsigns then hit 5 (enter) when you get to where you want. Kerchunk the radio then go back to 'normal' (CQ's). The DVAP should go to where you tell it.
The memories will populate each time you add one, rather than overwrite previous ones, unlike some of the other radios, so just keep scrolling...

You can save the working routines in physical memories too, when you get there. Say your 'CQ' channel (CQCQCQ) is 100, you could save the Unlink command (7 spaces then 'U') in channel 99, Reflector 5A ('REF005AL') in 105, Reflector 1C ('REF001CL') in 101...etc.

Just remember, Unlink first, just to be sure (you get either 'Not Connected' or 'Remote System Unlinked' from Robin come back), then tell the DVAP where you want to go, listen for the 'Remote System Linked' then go back to the CQ channel when you want to talk.

Its quite simple when you get the hang of it :-)

Cheers,

Neil G7EBY.

FWIW: A really quick and easy way to switch back to CQCQCQ is to simply change channel, then back again, when you select a channel it always defaults to CQCQCQ in UR, so you're good to go then.

Well that's how it works on my IC80.

That will just confuse the OM as he doesn't have the software, plus we use 12.5KHz channels in the UK :-)

From: ka2jse
Topic: 1351 Message: 1351

I have the DVAPdongle and am using dvaptool 1.02 with an IC-92AD. I'm wondering how or if I can add my name and location to my transmit so others can view. Sorry if this is a basic question but this is all new technology to me and a search didn't yield what I'm looking for. Thanks

eds memory stuff was taken off the following website

http://www.dstarinfo.com/DVAP-Memories.aspx

Om that site you will find all kinds of stuff for radios.....and the DVAP dongle.

The site is NOT easy to find!

pk

1354. yes i do

yes neil i do have the software,if you are talking the rs92 stuff for the 92?

I have had it for weeks. I just dont have the cable

Did you all know that the software for the e92 is FREE at icom usa, and the rest of the world, only in the UK are we still being charged £78 for cable and the cd.Soooo we are paying £78 for just the cable.

THAT could only happen in the uk.

Anway more to the point I have no real problems now with the DVAP, but i do have BIG problems with FREDS windv constantly disconnection me, when i connect to dstar reflector or repeater, its ok we know why.Its because fred
is possibly disconnecting me deliberatly.This NOT the place to discuss that though, thats for sure.

It's not meant as an insult; at least in the US, the term "Old Man" refers to any male Amateur, no matter how old they are. Female Amateurs are referred to as "Young Lady" no matter the age.

Easy!

Press MENU ---> scroll to MESSAGE/POS --> choose TX MESSAGE where you can configure what you want to say on transmit.

Hello barrymung!
thankuyou for your convern about my well being and the radio, HA! HA!
:)
Yes, i am getting the hang of it. Having said this I am now pulling the plug from monday omwards for me and dstar, I MAY return to it at a later date, im sending the dongle back. This is the rsult of a "run in" with a certain scottish station, fairly newly licemced in dunstable.

When i get accused of being a pirate, and siad person then goes to the ends of the earth searching google all about me, and THEN tells an american station to do the same, stirring up trouble for me, its time to get out of dstar. Ihis is all because i CHOOSE not to say whwre I am on qrz. This was my first encounter with dstar,and it likely be my last, I am NOT impressed.He and the other american station even talked about trying to get my callsign banned from dstar. I had to emnail the relevant admins to put my side of the story.
I love the technology, but the social side of dstar leaves much to be desired. BTW neil i never let ANYONE from amateur radio come to our home.

the dongle
nice peace of gear, well made, clever stuff, and high quality.

I dont really expect robin to allow this posting.

email me personally on your views neil, i will look forward to it.

patrick

1360. DVAP Gone Deaf - Noise Floor "Stuck" at -127dBm

Yahoo group: DVAPDongle
Date: 2012-01-21 17:42:24 UTC
From: mike_cll
Topic: 1360 Message: 1360

Howdy-

Great group here.

I wondered if there might be any suggestions regarding an issue that has recently surfaced with my DVAP.

The device has always worked flawlessly until recently. The computer still recognizes it, and I have the latest DVAPTool software (1.02), however the noise floor never comes alive. . it is "dead" at the bottom limit of -127dBm. . when I transmit with my HT, the DVAP will only hear me if the HT is literally 2" from the DVAP, otherwise no response.. this is even with the squelch "wide open."

I wondered if there might be any suggestions or if anyone has encountered this before. I didn't find any similar reports after doing some searching.

Thanks!

This is from Ham Radio Outlet, one of the largest retailers in the US. Doesn't really look free to me.

(hopefully the following picture and text make it through the Yahoo filters)

[Description: IC-RS-92]
PGM SOFTWARE AND CABLE FOR IC-92AD
IC-RS-92<http://www.hamradio.com/detail.cfm?pid=H0-009332>
$99.95

The software is free for the IC80/880 and the ID-31, but not for the IC-92.

Patrick,

Sorry to hear your experience has been thwarted with these problems and, sorry I didn't see your message until just now, you changed the subject line (again) :-)

I did recently (well last year), talk to someone who knows you, plus I believe we have chatted on a repeater briefly a couple of times, so I do understand your concerns about certain people trying to 'track you down'. Notice I have not put any location or repeater ID in this message, as you may or may not know, I do cover all off the UK for work, so it could literally be *anywhere* hi hi.

Strange that you chose a date in the future to decide to stop using the DVAP, if the problems were that bad, most people would of pulled the plug already, packaged it up ready for shipment back Monday morning.

Can't say I've heard you on D-Star, but obviously you have had some enjoyment out of it, otherwise you wouldn't be possibly coming back.

And yes, the DVAP is a nice bit of kit to own, shame you are returning it.

Take care,

Neil G7EBY.

1367. Software

Yahoo group: DVAPDongle
Date: 2012-01-22 13:38:45 UTC
From: John Parkins
Topic: 1367 Message: 1367

Hello All,

Not that I'm being pushy or anything..... but didn't I read here
that there might be some updated software for the DVAP around
Christmas time. Just wondering.

OK
Many thanks to the emails from some of you suggesting i dont let "them" get down. They won't! lets just say I'm having a break from dstar.
Speak to you again soon (whoever you may be).

Glad to hear about the software updates Robin, all good stuff.

Hello barrymung!
thankuyou for your convern about my well being and the radio, HA! HA!
:)
Yes, i am getting the hang of it. Having said this I am now pulling the plug from monday omwards for me and dstar, I MAY return to it at a later date, im sending the dongle back. This is the rsult of a "run in" with a certain scottish station, fairly newly licemced in dunstable.

When i get accused of being a pirate, and siad person then goes to the ends of the earth searching google all about me, and THEN tells an american station to do the same, stirring up trouble for me, its time to get out of dstar. Ihis is all because i CHOOSE not to say whwre I am on qrz. This was my first encounter with dstar,and it likely be my last, I am NOT impressed.He and the other american station even talked about trying to get my callsign banned from dstar. I had to emnail the relevant admins to put my side of the story.
I love the technology, but the social side of dstar leaves much to be desired. BTW neil i never let ANYONE from amateur radio come to our home.

the dongle
nice peace of gear, well made, clever stuff, and high quality.

I dont really expect robin to allow this posting.

email me personally on your views neil, i will look forward to it.

From: Michael Dodge
Topic: 1360 Message: 1370

Thanks for the reply, Fred. Have you found a way to clear the issue by chance? I've tried everything (reboot, reinstall drivers, download software over again, etc.), but the issue persists.

Mike

Subject: [DVAPDongle] DVAP Gone Deaf - Noise Floor "Stuck" at -127dBm

Hi,

HA! So I am *not* the only one with that, using fw V1.5...

Every now and then, this happens. It *seems* to be happening
when I try to transmit just as someone else keys it up from the
network side ("doubling"), and this usually is not a problem, but,
as said, every now and then it results in the device being 'stuck'.

Sometimes the RSSI freezes as well (like what you see) but
most of the time when this happens, it just stops receiving. The
weird thing is, that *transmitting* still works fine: I hear everying
come in just fine, but it no longer receives me..

Weiiird!

Howdy-

Great group here.

I wondered if there might be any suggestions regarding an issue that has recently surfaced with my DVAP.

The device has always worked flawlessly until recently. The computer still recognizes it, and I have the latest DVAPTool software (1.02), however the noise floor never comes alive. . it is "dead" at the bottom limit of -127dBm. . when I transmit with my HT, the DVAP will only hear me if the HT is literally 2" from the DVAP, otherwise no response.. this is even with the squelch "wide open."

I wondered if there might be any suggestions or if anyone has encountered this before. I didn't find any similar reports after doing some searching.

Thanks!

Hi Peter. The key is to make sure the FTDI drivers are properly installed. If they are, you will a device like /dev/cu.usbserial...

If you don't see that device, the drivers are probably not installed.

From: kc0siq
Topic: 920 Message: 1374

Hello all!

I've searched around at the various websites, can't really seem to find many DVAPs for sale used. Those that are , are usually listed full price. I'm looking to start playing with the DVAP, but don't want to drop the amount of money they are wanting for a new one.

If anyone has or knows of a used DVAP that I could purchase that is a bit cheaper, I'd appreciate a message.

I was in a similar situation around 8 months ago, just keep watching the auction sites like eBay. I was lucky enough to pick one up for 170GBP as opposed to the 250GBP* for new, still not cheap, but they are a very versatile piece of kit, basically anywhere you can get the internet you are on DSTAR, and you dont have any of the disadvantages of a Dongle.

*yes that's right, we pay 250 pounds, you guys in the states pay 250 dollars, something wrong there methinks.

I think that's because of the ridiculous "Value-added tax" your government imposes over there, something we keep fighting to keep from being imposed over here. Every now and then some American politician brings up the idea to generate more revenue.

"Politics," from the words "Poly," meaning many, and "Tics," meaning blood-sucking insects!

To stay on topic, I own a DVAP and wouldn't part with it. It is one of the most useful and dynamic pieces of kit that I own. The non-availability of used ones speaks to how much they are liked by their owners.

1383. Re: WTB DVAP

Yahoo group: DVAPDongle
Date: 2012-01-26 16:56:05 UTC
From: Jess
Topic: 920 Message: 1383

I broke the SMA adapter which came with my DVAP by leaving it and the "stubby ducky" antenna attached to my DVAP in my briefcase. The torque generated when I moved stuff around in the briefcase pulled the SMA adapter apart. I bought a replacement, then realized that I could fix the original adapter by carefully pressing the bent pin back into place. It worked fine so now I have two.

Now I leave the right-angle SMA adapter connected to the "stubby ducky", not the DVAP, so there's never any torque on the adapter. I have to waste a moment reconnecting the antenna to the DVAP but it's worth the extra half-minute to avoid damaging the connector.

I think the DVAP is a great tool. I use it frequently. I'd stopped using my DV Dongle for several months but when Robin released the updated software I began playing with it again. It has features the DVAP doesn't, so lately I use both about equally.

Check to see if Norton Firewall has a configuration section where you unblock programs as well as ports. Also, check the Norton logs to see if it shows why it is being blocked.

You are running the latest DVAPTool.

1389. DVAP on Ubuntu 11.10 - Device not opening...

Yahoo group: DVAPDongle
Date: 2012-01-31 14:14:45 UTC
From: jpthegeek
Topic: 1389 Message: 1389

Greetings!

I'm having trouble getting the DVAP Tool running on Ubuntu.

Version is 1.02 running on Ubuntu 11.10.

Plug in the dongle and get the pulse. Tool launches and allows config for call & freq.

Try to open the device on the proper USB0 and nothing happens. Get "device opening" indefinitely. No time out or error.

I removed BRLTTY, still no luck ever after restart.

I'm sure I'm missing something obvious. Help is appreciated.

Regards,

jeremy - ki4ylu

Hi Jeremy. If you have more than one ttyUSB device, try the other. Also, try running from the command line and look at the messages that come out there.

I just ran a DVAP on Ubuntu 11.10 with no issues so it should work there.

Feel free to send the output of the program to me directly via email if you continue to have problems.

1391. Tablets with Dongle and Dvap

Yahoo group: DVAPDongle
Date: 2012-01-31 14:48:41 UTC
From: Dave
Topic: 1391 Message: 1391

Robin, Will the Dongle and Dvap work on a tablet (iPad2, Amazon's Fire, and other tablets with the Android OS) I know most of the smaller (7 inch)tablets have a micro USB port. The iPad may not have any ports. Thanks

Awesome that you are thinking about though.

I stopped traveling with a notebook about a year ago due to iPad's functionality. Adding DVAPDongle capability (in the future) would make my day even better.

Cheers Robin!

Dave,

There's actually one pretty big issue in doing it (although there are some workarounds)

How many microUSB to minUSB cables have you seen? They aren't a normal cable.

USB is a master / slave configuration. Slaves plug into masters. The iPad and the DVDongle are both slaves. The iPad is designed to plug into a full computer as a slave.

Yes, Apple does have an adapter for cameras, but indeed it is a specialized adapter to convert from slave to master to slave.

Hello Jeremy,

I agree with you and I do actually the same thing, the tablets are thin, fast, light weight and small, there is no doubt it much betters, even than netbooks. I hope as soon as possible we have it working our Dongles.

Best regards.

73s,
Ed - PY2VR

1396. Re: DVAP on Ubuntu 11.10 - Device not opening...

Yahoo group: DVAPDongle
Date: 2012-02-01 14:29:51 UTC
From: jpthegeek
Topic: 1389 Message: 1396

Cheers Robin, thanks for the quick reply.

Was able to get the DVAP working last evening. Here's what I did:

1. Verified the 'pulse" once again.
2. Checked for additional devices on USB.
3. Clicked on USB0 device in the drop down.
4. Restarted app.

It worked. Operated last evening via Ubuntu 11.10. Merely clicking and verifying that the device was active seemed to do the trick. Wanted to throw this out in case anyone else ran into the same thing.

Thanks again.

1397. Re: Norton Firewall Blocking DV AP Tool (No Gateways Found)

Yahoo group: DVAPDongle
Date: 2012-02-01 23:13:14 UTC
From: fineshot1
Topic: 1385 Message: 1397

Yes - i did check the logs and it does not tell me much, and in fact it looks like the norton firewall is allowing it but i continue to get blocked anyway. This is the corporate version of norton firewall so its not quite the same as the normal version.

In the configuration tab i do have dvaptool.exe setup as an allowed app but still it happens. i guess i am just lucky(haha).

Thomas,

Who registered you and where? Registration is a multi-step process (as outlined at www.dstargateway.org<http://www.dstargateway.org>) and if you signed up at a repeater, then the sysadmin has to approve you and then you have to register a terminal. The entire process can take a few hours, or a few weeks if the sysadmin doesn't happen to notice that you have registered.

Doing it would require a special adapter, as the Android phones and tablets have to receive power over the connector as well.

Hi Matthew. The DV Dongle and DVAP use very little power and, as a result, do not require power other than from the tablet or phone.

Hello Robin,

It's not that an Android device couldn't provide the power, it's that the USB subsystem isn't intended to work that way; on current Android phones (at least this is the case with my Pantech Breakout) the version of Android installed likely doesn't support Host mode, which was first implemented in Android 3. Even support for Accessory mode isn't likely to be available, as that was backported to 2.3.4 of Android, which isn't a common platform for phones. This may also be the case with iOS, but since I'm not familiar with the development system for that platform, I can't say for sure. If you want to discuss this further with me, feel free to email me off the list, since I doubt too many folks here are interested in the internals of their cell phones.

Hi Matthew. Both my Motorola Xoom and my Samsung Galaxy S II have on-the-go USB ports. The Xoom works fine talking to the DV Dongle. The S II will power it up but, as you state, needs 4.X ICS to have host mode API support (since Samsung will not be releasing 3.X for it). That is supposed to happen in the next month.

I imagine that, by Dayton, both devices will support the DV Dongle. :)

It does not mention a microphone and has no bluetooth so audio input might be tough.

I did not think about blue tooth. I think these use a 4 conductor headphone/mic jack. There is a cheaper one that is MIPS instead of ARM. $99.

Mark did you do any special settings - like FM? PAcket or something to get it to work - tried playing with it on my Kenwood d710 and can't get it to work as of yet. If anyone has any suggestings for getting the crossband functionality to work solidly that would be awesome.

It all depends on how the radio connects the receiver to the transmitter. The ID-2820 seems to be doing it before all of the audio shaping stages, which allows the digital signals to pass through. Most radios seem to have done it after the audio stages, which generally means that it won't work.

So in general, that means, if it works, it works. Except for setting up the cross band repeater itself, there usually isn't anything else you can do.

1412. Using a DVAP and D-RATS on D Mode Reflector

Yahoo group: DVAPDongle
Date: 2012-02-28 03:44:23 UTC
From: ann_charles2001
Topic: 1412 Message: 1412

I have a D-STAR radio with D-RATS on one computer. The radio has a serial connection to D-RATS. One computer two,I have a DVAP connected to the Internet. The DVAP transmits and is received on the Reflector. When another station sends data, the DVAP does not show the data on the screen, but I hear the radio beeping. When the two station do a alternate data count, one count odd numbers and the other counts even numbers, it works great. The counting is a very short message. When I set the station to send Raw Data, the data cuts off after about threes words. I have used different computers with the same results. It seems like a buffer is full or overflowing. When we work the Reflector with a couple of DVDongles,they work great. They send messages, chat, and file transfer just fine. Can you offer some help?

1413. DV Dongle Quit working after switching to MAC OS 10.7 Lion

Yahoo group: DVAPDongle
Date: 2012-03-01 18:51:17 UTC
From: Michael Kaufman
Topic: 1413 Message: 1413

I am needing some help! I have both the DVAP and Dongle and have been using them on my MAC's for several years without a glitch. I have upgraded the Dongle software to the latest just after the first of the year and still no problem. Yesterday I upgraded both to OS 10.7 Lion and the dongle will not work on either computer. I tried switching the USB connection cable and did a fresh download from the website and reinstalled the software all with no luck. The green light flashes on the dongle but the error message said there was no dongle connected. Any Ideas?

You could try installing the latest 64-bit FTDI drivers for OSX?

Hi Johnny. Both the DV Dongle and DVAP use "linking" to connect with gateways/reflectors. Callsign routing is a feature of the Icom G2 repeater software. I'm working on a way to implement the same type functionality.

Thanks for the reply robin and thanks for all you do with this project. Got my dvap the other day and it's been working great. Was wondering if there would be ever a chance to implement the dvap with IPHONE, by just simply connecting the two together via USB cabling, but use an external 5 volt or whatever dvap needs to have for being powered up and just be able to use the data from the IPHONE?? Don't really want to use the power from the iPhone.
Thanks in advance:
Johnny, w5pfr

By default, the iPhone is a USB slave, not a master. The DVAP is a slave. Two slaves can't talk to each other. Remember, both the DVAP and iPhone are designed to plug into a full-fledged computer. With some of the latest iOS updates, this may be changing.

One of the big issues with call sign routing is that a D-STAR repeater requires an non-translated IP address with specific ports opened through any intervening firewalls. So when call sign routing is used, your local repeater starts a connection with the IP address of the remote gateway computer.

With a DVAP/DVDongle on a PC, quite often, your PC is behind a NAT (Network Address Translation) boundary. This is easily seen if you run ipconfig and have a 192.X.X.X, 172.X.X.X or 10.X.X.X address. If you are behind a NAT address, the outside world can't initiate a connection to you unless specific routing is setup in your firewall/routing.

This can be worked around by allowing your client to connect to a remote service and then having the service contact you when someone routes to you, but that's not the way that the native Icom Call Sign routing works, it expects to talk directly to you.

Both of these issues come back to the fact that both the iPhone and DVDongle were designed as client devices and not server devices. While they may seem similar, there's some significant technical details that make the two different.

Well the radio using the DVAP is creating the call route for the DVAP to pass. The DVAP is not supposed to do the routing.

But what do you mean by AN "ICOM pattend?"

Was trying to connect to my friend, by callsign routing, which you will set ur field to whoever u want to connect to, and was explained, that was a future of the g2 software in icom dstar repeater. Maybe in the future we can do that with the DVAP. I thought icom had that part of the programming patent, so no one else would be able to use it

1426. Question on using

Yahoo group: DVAPDongle
Date: 2012-03-10 01:16:30 UTC
From: wolobmp
Topic: 1426 Message: 1426

Hello all.

Have a question about the usage of this device. I looked thru previous postings but didnt see anything pertaining to this so here's my question.
I have an Android smartphone Droid Razr (unlimited data 4G LTE plan) and I connect this smartphone to my LapDock 500 Pro (branded with the Motorola logo, but am sure not made by Motorola). This Lapdock 500 Pro model is configured very similar to a laptop. It had ports for: keyboard, mouse, usb ports, Ethernet connection, extrnal monitor and speaker/mic, SD-card reader. As an example, when the smartphone is plugged into my Lapdock the Lapdock functions as a laptop, and I'm able to answer calls, and make calls right thru the Lapdock itself.

With this background info....is it possible to connect a DVAP Dongle to use on DSTAR? I also own and use the Motorla Xoom tablet but this tablet does not have unlimited data, so thus I use the Lapdock moreso. I own an ID-31 but understand a uhf version is in the works but still sometime away from production.
I would like to access the DSTAR network using this configuration, and also have access to a 2mtr DSTAR rig.
Any thoughts; suggestions on this type of setup?

I'm hoping that with merging 4G LTE wireless network (Android OS) with DSTAR would really be great fun.

Thanks for reading, I'm open to comments.

You need to run the DVAP client in order for it to work. Your dock is simply running Android. Currently only Windows and Apple OS will run the DVAP client.

The short answer is that configuration will not work.

Dear Mike,

Not familiar with the lapdock but I assume it uses the andriod system? If it does I dont think there is a version for the DVAP that runs under andriod.

What OS does it use?
You have to install some drivers for the DVAP to work. I know there are window OS drivers not sure about any other OS.

1433. Repeater Routing

Yahoo group: DVAPDongle
Date: 2012-03-13 15:59:49 UTC
From: rabbicy
Topic: 1433 Message: 1433

Can I use the DV-AP for repeater routing (I know callsign routing won't work) but what if I want to access a repeater only? Or, can I only access reflectors? Thanks.

Cy Stanway VE3IFS

From: aa4rc
Topic: 1433 Message: 1434

Hi Cy. You can link to both gateways (repeaters) and reflectors. For example, to link to repeater W4DOC module C, use "W4DOC CL" in URCALL.

From: rabbicy
Topic: 1435 Message: 1435

Okay, I got the DVAP all installed and working but I get a message that says 'receive only.' How can I transmit audio so the world can hear my melodius tones?

1436. Re: Question for a DVAP newbie

Yahoo group: DVAPDongle
Date: 2012-03-15 00:44:13 UTC
From: aa4rc
Topic: 1435 Message: 1436

Hi ? (I didn't get your name).

You need to be registered on one DSTAR gateway in order to transmit anywhere in the network. Take a look at http://www.dstargateway.org for instructions.

From: Rabbi Cy Stanway
Topic: 1435 Message: 1437

Hi Robin,

I am registered. That was not the issue. The problem was that the callsign entered into the URCALL area of DVAPTool was VE3IFS A and not just VE3IFS. I changed it to my call and lo and behold, everything worked just fine. This little doohickey is working perfectly and gives me so much more flexibility than the RF input through a NY repeater which, as good as it is, is still limited with the reflectors I can access. A whole new DStar world opened up.

1438. Dvap looses gateway after a few connect and disconnects

Yahoo group: DVAPDongle
Date: 2012-03-16 13:39:47 UTC
From: w5pfr
Topic: 1438 Message: 1438

Strange problem I'm having here. I've tried different computers running XP with the latest updates, at home and at work. Sometimes it tells me, no gateway found, check ur Internet setting, and I know Internet is working, because I'm able to view web pages. I have to unplug dvap for awhile and reconnect and run it again and it may give me the good massage of, it's got the latest updates or sometimes no gateway found. This happens from different locations and different computers. The other problem is, once I'm connected to a repeater or ref, after disconnecting and trying to connect somewhere else, it won't work, and has to be shut down and try again, and hopefully it will connect. Strange thing is, I can stay connected for a long time, without any problem, but once I disconnect, and try again, sometimes no luck.
Any ideas???
Thanks in advance:
Johnny, w5pfr

1439. Re: Dvap looses gateway after a few connect and disconnects

Yahoo group: DVAPDongle

From: aa4rc
Topic: 1438 Message: 1439

Hi Johnny. The DVAP does not interact with the internet connection so disconnecting/reconnecting will not impact connecting/disconnecting.

The "no gateway found" message shows that you were unable to connect to the name/auth server. The problem still sounds like an internet issue. Are you using wifi? If so, try a cabled connection to the internet.

When you click "Open", it verifies the DVAP and then connects to the name/auth server. If you receive the "no gateway" message, try clicking close and open again.

I looked through the logs and saw you connect several times to both the name/auth server and REF004/K5TIT/K5RKN.

From: Gerald L. Dubzak, Jr. (W2GLD)
Topic: 1438 Message: 1440

Robin,

I think it's more than Internet related as I too have been encountering the same issue on Windows 7 64-Bit and Windows XP 32-Bit. The problem arose with this latest round of Windows updates released earlier this week... The connection has issues on startup of the DVAP Tool and then looses connection to the gateways quite often once you are able to establish a connection. If I roll back the Windows updates, the issue goes away... I think some investigative work is still needed here before we simply blame the ISP connection!

Regards,

Jerry - W2GLD

I have tried wired and wireless and it does it both ways. I was trying it out and it did work ok that last time, but at one point it told me that I was on, RECIEVE only, when connected to REF1C, but after a couple of try's, it went in and worked. I'm at work now and listening on REF1C, and staying idle and no problem so far. At first I thought it may have been firewall issues, but had them off and it did the same.
Thanks,
Johnny, w5pfr

Hi Scott. If you have a frequency counter, you could watch as you adjust the calibration. If not, just adjust up and down to find the sweet spot for your choosen frequency.

Are you sure that your radio didn't go off frequency? Before changing frequencies of anything, you should always make sure that you are testing against a calibrated source.

Crystals are finicky things. They change frequency when they warm up, they change as they get older, and they can change if they get hit in the wrong way. And the higher in frequency you go, the more pronounced the change is.

With FM and Digital, you can often be quite far from each other in frequency and you'll never notice it. Only when it becomes too far does it become a big issue. It wasn't too many years ago when just about every ham had a frequency counter to keep their radios on channel. But the VHF/UHF fully synthesized radios have slowly changed the practice.

Frequency change, just happens.

1447. Make programming your radio for a DVAP easier

Yahoo group: DVAPDongle
Date: 2012-03-18 20:08:48 UTC
From: Woodrick, Ed
Topic: 1447 Message: 1447

In case you haven't seen it, for anyone new to the DVAP, DSTARInfo has the ability to create an import file for your radio to work with your DVAP. Just head to http://www.dstarinfo.com/DVAP-Memories.aspx , specify the frequency that you want to use for your DVAP and specify some of your favorite reflectors and you can quickly load it into your radio's programming software.

Hi Martin. Just make sure you are linking to an active reflector/module. Try REF001 module C or REF030 module C. Those are usually active. You can also check activity by going to the status page of the reflector (e.g. http://ref001.dstargateway.org).

Yes, they'll be AMBE-encoded. You'll need to process them using am AMBE decoder chip (eg. like in the DVDongle) in order to convert them to a format like wav or mp3. If you have a DVDongle, it shouldn't be too difficult to write a small program that feeds the ABME-encoded data in and captures the unencoded raw audio out, then use something like SOX to massage the raw format to wav, mp3, etc..

1457. D-Star Repeater access issue

Yahoo group: DVAPDongle
Date: 2012-03-25 09:28:11 UTC
From: m3nsy
Topic: 1457 Message: 1457

I have recently purchased a DVAP. I have programmed up both my E80 and 2820 to use with it.

When I try to access a D-Star repeater which I normally use using the DVAP I get the voice prompt ' remote system linked '. When I change over to CQCQCQ and try transmitting nothing comes out. Neither do I recieve anything from it

I have done the same test but on other gateways / reflectors and it works perfect.

Is this a problem with the repeater that I am trying to use.

I have checked the settings of the radio and it all seems fine. The L is the 8th character in the repeater callsign, GB7OK..L.

I have also switched my cable modem/router off/on

This question might have already been asked of someone but I have had a look and could not find anything similar

Thanks

Ed
M3NSY

Problem solved. I missed out putting the port letter in the settings.

Works fine now

Ed

Ed,

Just saw your post. Glad you worked it out :) Seems like our discussions helped in the original setup.

Have fun with it and maybe I will catch you from Australia as VK2DYI :)

Hi (didn't get your name nor callsign).

If you include your callsign, I can look it up. If you are fully registered, you have a "terminal" created in the registration database that matches the 8th character of the MYCALL field. If you don't have that configured, it will keep you from transmitting.

Make sure you are registered to use the Gateway. You can do that on any US trust servers. Just takes one time to register and your good to go.

Hi Jerry. You have and "A" and "B" terminal registered. You need to register a "space" terminal. Just follow the instructions at http://www.dstargateway.org. In the mean time, if you place an "A" or "B" in the 8th character of your callsign (so KC7HA space space A), you should be able to transmit.

1467. Dup packet

Yahoo group: DVAPDongle
Date: 2012-04-03 12:32:01 UTC
From: m3nsy
Topic: 1467 Message: 1467

Hi..

If I am connected to a gateway via DVAP and listening to a QSO , I sometimes get DUP PACKET (-1) with the (-1) increasing in numbers, 1,2,3, etc.

The QSO I am listening to becomes very intermitent with the audio dropping in and out.

I have tried changed the DVAP frequency and my laptop is connected directly the wireless modem/router but I still get this problem.

Anyone else had this problem

Hi Ed. The dup packets are coming from the internet to your DVAP connected PC. VOIP protocols like dstar use UDP (datagrams) to communicate. UDP does not have any retransmit or pacing mechanism so it is more real-time. Unfortunately, that means when you drop a packet, it is gone. Routers in the path between the reflector/gateway and your PC can just drop UDP packets if they get congested. They can also sometimes duplicate a packet. That is usually what is happening when you see the DUP PACKET messages. It is pretty much a warning that the internet connection between you and the source host is having difficulties keeping up.

Sometimes it can be something as simple as "the wife/husband" streaming a video or downloading a CD/DVD image while you are operating. The little linksys/netgear/dlink routers are notorious for not keeping up.

Thanks Robin

The ADSL modem I use has a built in wifi. The modem, technicolour, plugs directly into the wall and is supplied by the telephone company.

I might have to change it for a belkin adsl modem to see if that solves the problem

1470. D-STAR Class at Dayton Hamvention

Yahoo group: DVAPDongle
Date: 2012-04-04 19:11:32 UTC
From: wb4qdx
Topic: 1470 Message: 1470

There are many new D-STAR users and we can help them get the most out of D-STAR. DSTARinfo.com will be hosting a class during Dayton Hamvention 2012 to help those new to D-STAR learn the basics and how to experience all of the features and capabilities of D-STAR. If you are going to Dayton Hamvention this year and are a new D-STAR user or know someone who could benefit from a comprehensive D-STAR class for new users, here is the info.

The three hour class will be held on Friday morning from 9:00am to 12:00 noon at the Drury Inn Ballroom, 6616 Miller Lane, conveniently located near many of the Hamvention hotels. The class will be given by experienced D-STAR instructors who have conducted D-STAR training across the country. The cost of the class is $25.00 and advance registration is required. All participants will receive full course materials and a chance to win an Icom ID-31A handheld radio. Register before April 25th and receive a special edition t-shirt at the class.

For complete information and to register, visit the DSTARinfo.com website
<http://www.dstarinfo.com/d-star-infocon--dayton-hamvention-2012.aspx> .

Ed,

I sometimes get this with mine. Often it is related to the repeater. Do you get it more often of connected to GB7OK rather than the reflector? It could be on the other end. Also I can have days where this happens a lot and others where it doesnt happen at all so I have learnt to live with it.

Sometimes when I am connected to the Australian repeater it happens also but other times it is fine all day.

Hi All. It is usually an issue of congestion on one or more routers somewhere in the path between you and the gateway/reflector. Dup UDP packets are permitted per the spec. I put the DUP message there just to show when there were issues with the connection.

Interestingly, you can get the DUP message when so many packets are lost that the sequence numbers wrap around.

Hi Andrew

Yes just on GB7OK this happens. I was connected to Ref 12A for a few hours the other night and there was no problems. Same on 5A. It just happens with GB7OK.

I am changing my ADSL wireless modem router to see if this makes a difference

Hope you are having fun down under in VK land. If you get boref and want to arrange a sked with me and the others let me know.

Hi Robin

Dup packet only seems to happen on the local d-star repeater, GB7OK, that I use. It does not happen if I am connected to another repeater or reflector.

Unfortunately GB7OK has an intermitent internet connection so it is not always on during the day / night.

There must be an issue the repeater side / internet gateway if others are also experincing this

1475. No Transmit audio

Yahoo group: DVAPDongle
Date: 2012-04-07 01:48:34 UTC
From: RalphH
Topic: 1475 Message: 1475

I purchased a DVAP this morning. Installed it, Set my radio up. Connected to reflector 12A. I hear people talking. I see myself (K1GGS P) connected to the reflector. I get a "Connected to Reflector 12" voice notification.

Issues is that nobody can hear me. When I do an echo test with the DVAP it sounds fine. I have the radio set up with

My Call: K1GGS P
UR Call: CQCQCQ
R1: Direct
R2: Direct

I'm sure I've missed something. I did add the Direct to the R1 and R2 fields in the radio. Should i leave them blank?

Rusty,

What's the "P" for at the end of your call sign in the "My Call" field?
With my radio (92AD) and DVAP just my call is in the field.

Been using the DVAP for weeks and loving it.

Robin

I've been registered on the system for over a year. I tried this morning and managed to hear one call using the DVAP. The HT works ok if I go to the D-STAR system on the air (not DVAP). Here is my info .

Registered on KI6KQU

Two terminals registered.

K1GGS 10.227.10.200

K1GGS P 10.227.10.201

I have the DVAP set up as K1GGS P and the HT (80AD) is also using the same call sign.

I've been listening to Refl12A on radioreference and talking using the DVAP and into the system on a repeater. I hear myself every time on the repeater, but only made it thru once on the DVAP.

Any suggestions?

Rusty

From: Rusty Hemenway
Topic: 1475 Message: 1479

Since I have two radios I have one with my base call sign and the other with a "P" for portable. Its been working fine for over a year. Since I'm registered with both call signs, I'll remove the "P" and see what happens. My original plan was to make the "P" a "A", as suggested by whomever wrote the instructions for the DVAP.

Rusty,

What's the "P" for at the end of your call sign in the "My Call" field? With my radio (92AD) and DVAP just my call is in the field.

Been using the DVAP for weeks and loving it.

I purchased a DVAP this morning. Installed it, Set my radio up. Connected to reflector 12A. I hear people talking. I see myself (K1GGS P) connected to the reflector. I get a "Connected to Reflector 12" voice notification.

Issues is that nobody can hear me. When I do an echo test with the DVAP it sounds fine. I have the radio set up with

My Call: K1GGS P
UR Call: CQCQCQ
R1: Direct
R2: Direct

I'm sure I've missed something. I did add the Direct to the R1 and R2 fields in the radio. Should i leave them blank?

Hi Rusty. I looked through the logs on REF012. You are using a "P" in the 7th position of mycall. It needs to be in the 8th. You can also just place a space there.

From: George R.
Topic: 1484 Message: 1484

I've received my used, but new to me DVAP today, but cannot get it installed.

I'm using XP and ran through the install steps. I've got my call sign in and recognized. A frequency in and recognized.

Then the trouble starts. It says "opening DVAP device Com5" and then "cannot open com port 5." Then "cannot open DVTool device Com5" and that;s where I am after trying this for over an hour.

I do have the pulsing green light.

I need help please,

George

Hi George. Is there only one com port in the selection box? If you have any other serial to USB type devices, they can show up as well.

Just click on the arrow in the com port selection box to see.

1487. DVAPTool 1.02: Can't link again after failed link attempt

Yahoo group: DVAPDongle
Date: 2012-04-15 19:00:52 UTC
From: w6kd
Topic: 1487 Message: 1487

Hi;

I'm using DVAPTool 1.02 on Vista 64, with a wired internet connection, and an Icom IC-92AD HT.

Things work OK until I try to link to a repeater that won't allow a connect (i.e. one that has has remote linking disabled). After that failed attempt, the DVAP Tool will not link to anything else. It has to be completely closed and restarted.

For example, I set UR: KD0NJCCL, RPT1: (blank), RPT2: NOT USE*, MYCALL: W6KD and try to establish a link to KD0NJC Port C. The DVAPTool text window shows:

Connect requested
Connecting to gateway KD0NJC
Cannot connect to gateway

I then try to connect to KC0CVU port C by changing UR: to KC0CVUCL

The text window shows:

Connect requested
Connecting to gateway KC0CVU

and then the connection is never completed. I have to close DVAPTool down and restart, then linking works again.

It appears that something is hanging from the original connect request. I've tried issuing an unlink command after the failed attempt to link (UR:_____U) and it comes back with "not currently linked" and does not help. My guess is DVAPTool is getting hung in a "connect in progress" state when the connect attempt is refused.

Regards

Bob Scott, W6KD

Robin,

Did ytou have intention to make a DVAP UHF module for make it compatible with Icom ID-31??

I want also get this beautifull handy, but i'm not sure because of my VHF DVAP, it useless with ID-31 !

I'm think creating Module UHF DVAP is a good thing ??

No, its to do with RF issues on the internal hardware not playing ball.
Until that is sorted out we won't be seeing a 70cms DVAP.

Me too, I'm also having this problem and while I'd like to blame vista for just about anything, I'm running OSX 10.6.8

I tried to connect - GB7WP BL - which failed, after that I couldn't connect to any of the nodes or reflectors I usually use.

I was thinking the same thing. I think the Rasberry Pi would be very interesting as it is a full computer for under $50 with ethernet and USB. Only problem could be that it doesn't have enough ram, but with a thin linux on it you may still be able to use it with less ram.

1510. Getting Started in D-STAR class at Dayton

Yahoo group: DVAPDongle
Date: 2012-04-26 14:53:41 UTC
From: wb4qdx
Topic: 1510 Message: 1510

There are many new D-STAR users and we can help them get the most out of D-STAR. DSTARinfo.com will be hosting a class during Dayton Hamvention 2012 to help those new to D-STAR learn the basics and how to experience all of the features and capabilities of D-STAR. If you are going to Dayton Hamvention this year and are a new D-STAR user or know someone who could benefit from a comprehensive D-STAR class for new users, here is the info.

The three hour class will be held on Friday morning from 9:00am to 12:00 noon at the Drury Inn Ballroom, 6616 Miller Lane, conveniently located near many of the Hamvention hotels. The class will be given by experienced D-STAR instructors who have conducted D-STAR training across the country. The cost of the class is $25.00 and advance registration is required. All participants will receive full course materials and a chance to win an Icom ID-31A handheld radio. Register by this Friday, April 25th, and receive a special edition t-shirt at the class.

Please pass along this information to anyone planning to be at Dayton and could benefit from the exciting D-STAR technology. To register, go to www.DSTARinfo.com/IC12 <http://groups.yahoo.com/group/DVAPDongle/www.DSTARinfo.com/IC12> .

Hi Bill. I use a Verizon aircard and I know several folks use Sprint hotspots as well. I had issues with AT&T and switched to Verizon for their data service.

I've driven to Dayton and Orlando for hamfests and used the aircard most of the way with good results.

I don't know why you couldn't...the DVAP is just a means of routing the RF packets sent by the radio via internet to a reflector or repeater gateway. The D-RATS data is embedded by the radio into a standard D-STAR data stream...the DVAP isn't changing that data, only routing it through.

A ratflector is a conference bridge specifically for D-RATS data connections. When a group of users are connected to one, everything sent to the ratflector is bounced to all other connected users.

I've been seeing all the traffic on a "gotta have" 440 xceiver/dongle. Why? Is there a 440 only D-star radio out there people will use? The IC-92AD is both. 2m and 440. Why would anybody only want to buy and use a dongle only on 440? Isn't the 2m portion of anybody's 2m bandplan allow for the simplex use of the dongle on 2m?

Dave,

Some people have been buying the ID31 which is a 70cm only DStar box and thus cannot access a dongle. I think this is where all the noise for a 440 device has come from.

Apparently the device has some funky features. Non of which I personally see that useful but many people will.

Andrew,

Evidently you may have missed what the "funky features" really are.

* Would you like the ability to buy a radio, open the box, hit a few buttons and you are on the air with NO REPEATER PROGRAMMING in less than 5 minutes?

* Would you like a radio that can quickly tell you the closest repeaters and how far away from you that they are?

* What about a radio with a built-in GPS?

And that's the short list of new features!

Dave,

Some people have been buying the ID31 which is a 70cm only DStar box and thus cannot access a dongle. I think this is where all the noise for a 440 device has come from.

Apparently the device has some funky features. Non of which I personally see that useful but many people will.

A lot of areas are putting a 440 D-star radio only.
440 is becoming the most used frequency.
I use my hotspot on 440.
the other dale.

----- Original Message -----

Dale,

Yes; many of the people requesting the 440 only DVAP either have the ID-31 or would like to buy it.

1530. DVAP Mobile 3G in UK

Yahoo group: DVAPDongle
Date: 2012-04-29 18:09:15 UTC
From: m3nsy
Topic: 1530 Message: 1530

Hi

I have read various posts on this group about running a DVAP mobile via 3G.

I was wondering if there was anyone in the UK on here who had tried it and what results you got?

I have run the DVAP with a Dell Inspiron mini 10 notebook which has been connected to my Samsung Galaxy S2 via tethering on the T-mobile network.

If the 3G signal is not brilliant I get the voice prompt command that I have been disconnected.

I believe the disconnection is down to the 3G signal dropping out. Anyone have any views on this. Is this what is causing the disconnection??

Anyone who runs a DVAP via this method have any suggestions on how to improve the signal. I have looked at the various 3G dongles you can get that have an external antenna port but I would not know how much gig to go for from 1gb - 15gb a month. I know it would depends how much you use it but it would not be a great amount of use and also the cost of having to have a contract.

I would like to be able continue to tether it via my phone if only I did not get the disconnects.

My Samsung Galaxy S2 does not have a way of connecting an external aerial.

A couple of us have found that quite often, a 2G connection is much more reliable than the 3G or 4G connections. Hypothesis is that the higher speeds are often saturated and UDP packets can get significantly delayed.

I've seen it where UDP packets are queued and delayed for 5+ seconds. Normal operation would say that UDP packets are never queued, just dropped, but the telcos her in the states seem to just queue them.

It's really interesting when this happens, because when you unkey, you can hear yourself talk.

Try forcing your device to 2G speeds and see if it helps.

DVAP has been working fine .
I turned on computer today and get "unable to query dvap dongle device".
Running Win7 64bit.
Tried reinstalling the driver and makes no difference.
It has been working on port 7 and no other ports listed.

Robin, AA4RC, was a guest on last week's DSTAR net on the Southern California PAPA system. During the Q&A he was asked about a 440 DVAP--he said that the signal quality on the 440 device they are testing is just a smidge outside the limits for certification of the device for sale in the US/EU, and that's what's been holding tham back. He also said that they are well aware of the growing interest and demand for a 440 dongle. (my paraphrase).

No green pulse. It is the only device on the device list.
When I select OPEN, it says "device open" for about 5 seconds and thens says the "unable to query...." message. During that time the blue light pulses about 15 times. No other lights displayed.

1539. DVAP issue when I request a new link

Yahoo group: DVAPDongle
Date: 2012-05-06 13:07:06 UTC
From: py2vr
Topic: 1539 Message: 1539

Folks,

I have experienced a issue in the last days. When I make the first link to a reflector or repeater DVAP works normally, perfect. However when I disconnect (unlink)and I request a new link to another repeater / reflector the DVAP stops and it don't make anyone connection. Making self tests with DVAP "My Voice Test feedback" and "DVAP System Test" I get the feedbacks, it's works normally.

To fix that issue I need to close the DVAP Application and reboot it, however the issue repeats when I unlink and request a new link.

Please anyone has experienced the same issue ? Could be a nice idea reinstall the DVAP Tool, it could be a solution ?

Thank you
Ed - PY2VR

1541. Major Problem with the DVAP/IC-92AD

Yahoo group: DVAPDongle
Date: 2012-05-20 23:55:53 UTC
From: markg
Topic: 1541 Message: 1541

Hi Guys, I loaded dvaptool 1.02 this morning and turned on the 92ad and linked to reflector 38C. Now, this afternoon I unlinked and then tried to link to 1C and it will not link at all. I can key the radio on unlink and I get the not currently linked and of course when I key on the memory channel that is for transmit it keys and I hear the tone that normally happens when you transmit.

I went through the process of installing the firmware again. I reset the 92AD and loaded the memories again and I even downloaded and installed the DVAPTOOL 1.02 again. And nothing seems to work!!!!!! I am getting very frustrated. And I also reboot the computer and reset the internet connection plus tried a new USB cable and it was to no avail! I don't know what to do. Any help would be much appreciated. Mark KB3Z

Robin, thanks for responding. The problem is not only 1c but any reflector when I try to use the dvap. This just started late this afternoon. That's why this is rather perplexing. I don't think it's the 92ad because I did a complete reset and reloaded everything from the installer program I have to the 92AD. Any other suggestions would really help. Thanks!!

Robin, I was searching thru the messages and I saw that someone had a similar problem as I do. When I try to link on any reflector I do not get the verbal linked message or can't link message. And yet when I key my 92ad on the unlink I do get a verbal "not currently linked". I turned off my fios modem and let it sit for about 10 seconds and then turned it back on. I then rebooted the computer and that didn't seem to work. The PC is making contact with the DVAP because the serial number of the dvap shows up on the DVAP tool 1.02. Should I unplug the Modem from the power supply and try to reset it that way? The only other devices accessing the modem is sirius radio and my PC. Trying to give as much detail as I can. Thanks!! Hi Mark. I just used my DVAP and connected to REF030 with no problems.

There is a known issue with DVAPTool though. If you try to connect somewhere and it fails, you have to just stop and restart DVAPTool to be able to connect to another system. You should not have to do anything with your modem or firmware.

This should be fairly rare since DVAPTool receives the list of active reflectors/gateways when you click Open. It should not allow you to connect if the system is not active.

Hi John. I looked through the server logs and saw you connect and receive the gateway/reflectors list several times last evening. There were no log entries of you trying to connect to a reflector or gateway though.

To which reflector where you trying to connect?

Hi Mark. I went back through yesterday's connection logs and did not see any glitches. There were quite a few dongles/dvaps/hotspots connecting all day long.

I saw where you requested the gateway/reflector list but never saw a connection attempt by your callsign. To which reflector were you trying to connect?

Howdy, I was trying to connect to reflectors. I have had this problem before approx two weeks ago. I resolved it by reloading the driver and dvap 1.02 software. Now I cannot seem to connect to anything. I am running windows 7 although I may move it over to my IMac and see what happens....Thanks

Hi John. You should never have to re-install the software nor drivers unless you have a crash.

I can look in the reflector logs after you attempt to connect and see if there was a problem. As I mentioned earlier, I looked through the logs and saw your request to download the gateway/reflector list but never saw a connection attempt on a reflector.

This can also be impacted by blockages in your local router. If I am on my corporate network, I'm not allowed to connect, because the network blocks it.

Hi Mark. I went back through yesterday's connection logs and did not see any glitches. There were quite a few dongles/dvaps/hotspots connecting all day long.

I saw where you requested the gateway/reflector list but never saw a connection attempt by your callsign. To which reflector were you trying to connect?

> Robin, I was searching thru the messages and I saw that someone had a similar problem as I do. When I try to link on any reflector I do not get the verbal linked message or can't link message. And yet when I key my 92ad on the unlink I do get a verbal "not currently linked". I turned off my fios modem and let it sit for about 10 seconds and then turned it back on. I then rebooted the computer and that didn't seem to work. The PC is making contact with the DVAP because the serial number of the dvap shows up on the DVAP tool 1.02. Should I unplug the Modem from the power supply and try to reset it that way? The only other devices accessing the modem is sirius radio and my PC. Trying to give as much detail as I can. Thanks!! Could you try from a different internet connection? We've seen a handful of routers that were buggy and did not pass traffic (like some Netgear units).

Also, try to connect to REF030 module C and post once you have done that. I'll look at the logs there.

I was running the DVAP tool on my older XP machine and it worked fine. Now I installed the same software on my newer Windows 7 (32-bit) machine and it is not working. It comes up and detects the dongle and I am able to open it. It will not respond to the transmission from my IC-91A. The signal strength meter shows it is seeing the transmission, but I get no response. Anyone have an idea as to why this is happening?
Thanks.

John,

Been having the same problem here in the UK. Over the last two days one successful connect to a reflector, then no subsequent reconnects have worked. Currently using hotel wifi with no internet general issues other than connecting to reflectors via the DVAP with IC-92D. Not had problems from home previously with same Ubuntu laptop.

Hi Robin, Well, I was successful with pinging 65.254.57.90 and here is what I got:

4 packets sent, 4 packets received, lost 0

Round trip time 44ms

I am going through the router since it appears to make no difference by going direct to computer....Any other suggestions? I just don't get it as all was working just great until the last couple of weeks!

Thanks

John

1566. Sporadic connection issues

Yahoo group: DVAPDongle
Date: 2012-05-24 00:03:42 UTC
From: ve3tyg@rogers.com
Topic: 1566 Message: 1566

It seems I too am now having issues seen in other threads in the last couple of days.

My DVAP is working, the software shows the serial number etc. and using DVAP E responds all echos normally. DVAP I announces as well.

I can connect to remote reflectors and repeaters sporadically. 29/30 tries, the dvap doesn't even respond, but it shows what I'm trying to connect to so I know it's decoding properly, it just won't connect. Then out of nowhere, on a connection attempt, it works and remains connected. I then disconnect, and subsequent reconnect attempts fail with no audible message as stated before.

I'm suspecting some kind of network issue, but perhaps on my end. Has the source been pinpointed at all? I've made no changes on my end except to try the DVAP on another known good MAC.

There have been some issues with a few of the reflectors in the last few days (i.e. REF001 is down, REF035 is having routing issues, etc).

For those having issues, please try to connect to REF030 module C. That is working well. If the connection fails, I can look through the logs there.

Hi Robin, to further clarify, I can connect to a node in one instance, then disconnect, then not be able to connect, nothing audible from the DVAP. Normally if a reflector is offline, I get "Gateway unknown", but in this case nothing is transmitted back from the DVAP. VE3YYZCL is a node I connect to regularly.

I did try to connect to REF030C but was unable to. I made the attempt at around 8:45pm EST.

Hello Robin!

I've been monitoring the e-mails of late and 'no' I don't have any issues to speak up about, but I'd like to make a point I made last year at Dayton when I was in front of you and a newly interested D-Star operator... I mentioned to the fellow standing there in the hallway, that I have never seen anyone like you to be so responsive and helpful with regard to support for your products.

Robin, I'm seeing that once again here on this reflector ...three days after Dayton when you should be relaxing and recovering from Dayton! Robin, my friend, there is no one better than you with active support and help! I hope the folks out there also see you're indeed 'standing behind your product' which has no equal!

Have a good night!

All,

Just connected to REF005C fine, then unlinked. Then can't connect to REF030C or any other connector.

DVAP terminal says :-
Connect requested
Connecting to gateway REF030

Then no sound from radio.

So looks like I'm having exactly the same (network?) Issues as others.

Problems here too. I was unable to connect to any reflector tonight and came here to see if there was a problem. I can connect to the DVAP with the I command, echo with the E command. But when I try to connect to any reflector nothing seems to happen at the radio end. I tried to connect to REF030C at midnight EST and this happened so maybe you can see something in the log. I do see that the DVAP Tool 1.02 (Macintosh) screen has the force disconnect button lit as if it thinks it has connected somewheres but it has not. If I try to unlink at the radio I get the you-are-already-unlinked message. Manually hitting the "force disconnect" button at the computer end does not work, the button stays lit. All I can do is to close the DVAP Device button. Then I open it again and get the usual dialog box about running the latest software. The Force disconnect button is then greyed out. If I go to the radio and try to connect to a reflector I get no response at the radio and I come back to the computer and see, again, that the Force Disconnect button is now lit but cannot be pressed. I am sorry but my computer is on a different floor of my home than the radio so I can't tell you what the lights do. Anyway, I hope this helps and I suspect it is a problem there at your end. Thanks.

Topic: 1566 Message: 1577

ROBIN I THINK I SEE THE PROBLEM.
Ok decided to play around a bit. I first pinged REF030C and saw that it was up and OK. I closed down the DVAP TOOL 1.02 and started it up again. Went to the radio and was indeed able to link to REF030C. I unlinked fine. Checked at the radio and saw that the force disconnect button was greyed out. Then I tried to connect to REF001A and got the no response. I tried to unlink and got the already unlinked response. But checking at the radio showed the force disconnect button was lit. Pressing the button would not disconnect but it stayed lit. I then stopped and restarted DVAP Tool. Went to the radio and was able to immediately link to REF030C. I unlinked. I linked again. Did it a few more times. Unlinked and went to REF001 and had the same problem and was unable to link to any reflectors after that. Going to radio showed the force disconnect button was lit so the DVAP thought it was connected at some level in its programming and yet was not able to disconnect. I then pinged REF001 (I assume that the address based on REF 30's that you gave would be ref001.dstargateway.org) and I got

Ping has started

```
PING ref001.dstargateway.org (66.151.17.198): 56 data bytes
92 bytes from 216.152.48.62: Destination Host Unreachable
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
4 5 00 5400 a38b 0 0000 30 01 87bd 10.0.1.4 66.151.17.198

Request timeout for icmp_seq 0
Request timeout for icmp_seq 1
Request timeout for icmp_seq 2
Request timeout for icmp_seq 3
92 bytes from 216.152.48.62: Destination Host Unreachable
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
4 5 00 5400 b326 0 0000 30 01 7822 10.0.1.4 66.151.17.198

and so on....
```

So REF001 was apparently down. I restarted and started DVAP TOOL and then linked to REF030, unlinked, linked and unlinked again. I then PINGed REF020 using the same address scheme. It did connect and returned the packets in normally quick time. So I then linked to REF20 and it worked. I unlinked. I linked REF030. I unlinked. I linked to REF020. I unlinked. I linked to REF001 (the down one) and got the whole problem again.

It seems to me that what is happening here is for some reason your software is not successfully removing reflectors from your list as being down. So they get loaded into the user's list. Then when you try to connect to a down reflector what happens is that the DVAP somehow thinks it is connected (although it does voice message it is not if you try to unlink) in the area of the software having to do with force disconnect. So when you connect to a down reflector there is no way for the DVAP to know it is disconnected or to foce itself to disconnect. Then when you try to connect to any other ref even ones that are up you get no response as the DVAP thinks it is connected at some level in the software

different from the level which would trigger the voice response.

In one message you mentioned that your software screen down refs from the user list. I suspect that is exactly the area where your problem lies.

It looks like the way around this is when it happens to ping a known ref such as REF030 and if it is there then quit DVAP TOOOL completely. Restart it. Then link to REF030C. Then, from there, link to any REF that is up (in my case 020 was up). Everything proceeds normally until you again hit a down repeater.

I hope this was of some help to you in finding a solution for us. Best 73. -- Neil

Hi Neil. There is a known issue with DVAPTool that has been discussed here in the last week. If you try to connect to a system that is down, it does not recover properly. I'm working on a fix.

If you fail to connect to a system, stop DVAPTool and restart.

73,
Robin

1585. Frequency Selection suggestions for DVAP?

Yahoo group: DVAPDongle
Date: 2012-05-29 04:40:55 UTC
From: ka1mzy
Topic: 1585 Message: 1585

I've read a few posts after a search but they are older about band plans etc posted back in 2010, but nothing specific on DVAP use.

Is there somewhere that specifies a bandplan for DVAP use?

I have an IRLP node at 147.515 simplex and an APRS Igate running on 144.390 of course. Both are roof mounted vertical high gain antennas with around 25watt each and I am wondering about interference between the three.

Can someone advise/suggest a frequency I might want use on the DVAP that may work best, considering my current frequency use?

No rush, as the DVAP wont be here until beginning of next month. Gigaparts was out of stock.

Thanks for any suggestions.

JP

In most places, 145.670 will probably be perfectly fine to use as there is very little D-Star simplex, but any unused frequency in your area would also be fine for your hotspot or DVAP, just as someone who wanted to run a simplex Echolink node might choose. I use a splinter frequency between two FM simplex channels for my hotspot.

1589. RE: [Western_D-Star_Reflector_14] Available Gateways

Yahoo group: DVAPDongle
Date: 2012-05-31 18:35:16 UTC
From: Kent Johnson
Topic: 1589 Message: 1589

Dear users of REF014:

I changed the IP for REF014 this morning to acquire a larger subnet (more usable fixed IPs for other VoIP applications). Users who were on REF014 when I made the change will need to disconnect/reconnect to acquire the new IP and thus a new connection The REF014 dashboard will indicate your connection.

Spread the word,

Kent W7AOR

1590. Re: Frequency Selection suggestions for DVAP?

Yahoo group: DVAPDongle
Date: 2012-05-31 22:45:25 UTC
From: kf6qcq
Topic: 1585 Message: 1590

145.670 is the frequency that the Los Angeles area has a DX spider packet cluster. Its been there for at least 15 years. So I'm thinking that in Southern California a different Frequency might be better.

1591. DVAP SERIAL PORT ISSUES ON MAC

Yahoo group: DVAPDongle
Date: 2012-06-01 01:32:17 UTC
From: nq2u
Topic: 1591 Message: 1591

New to DVAP. Installed it on my PC with no problem. On my Mac OS 10.5.8 machine the DVAP Device box is grayed out. I downloaded the correct driver from the FTD Serial site. The Device
box was not grayed out for the first time after I downloaded the Mac Driver from DVAP. Then when I entered my call sign it "Grayed Out"
Please help.
Tnx

1592. Re: DVAP SERIAL PORT ISSUES ON MAC

From: aa4rc
Topic: 1591 Message: 1592

Hi (I didn't get your name).

Try this:

1) unplug the DVAP
2) reboot the Mac
3) plug in the DVAP and make sure it is pulsing green
4) start DVAPTool

Note that the DVAP needs to be plugged in before starting DVAPTool.

Let us know your progress.

You might also run:

sudo usermod -G dialout $USER

to add yourself to the group that can access the DVAP without using sudo.

CORRECTION!

The usermod command sets the groups rather than adds them. The correct command is:

usermod -G root,adm,dialout,cdrom,plugdev,lpadmin,sambashare,sudo $USER

If you already ran the usermod command below, you probably need to take a look at:

http://maketecheasier.com/fixing-sudo-error-in-ubuntu/2012/01/03

How did you solve the problem ?

I just bought a red dongle at Dayton.
It was working a few days ago.
today I am getting the same error.
It is not reading the S/N from the red dongle.

The green led is pulsing slowly and
the blue led light up when the computer try to read the red dongle.

I have tried two different USB cable.

Any help ?

I need it to do a demo in VR2 and am leaving here tomorrow morning.

From: Graham Saville
Topic: 1533 Message: 1598

Hi after much changing of os (I use Lubuntu Linux) I found the solution seems to be simple.

Unplug DVAP
Power off PC (Complete shutdown)
Plug DVAP in
Then Power up PC.

Yes... I have done it with an Alinco DR-635T.

The Alinco simply passes the digital voice wihtout any decode or encoding, so the audio is straight through. Works a treat.

1602. Possible to recompile DVAPTool for ARM?

Yahoo group: DVAPDongle
Date: 2012-06-10 17:00:16 UTC
From: kd4ebm
Topic: 1602 Message: 1602

Hi Robin:
Nigel's/Craig's posts below about a DVAP appliance running on a small Linux board got me to thinking about how to do this.

Is it be possible to recompile DVAPTool for a non-Intel processor, like ARM? Or is just a non-starter? I'd be interested in either a DIY version or a finished product.

Cheers,
Bob

Hi Bob. I already have an Arm based DVAP and DV Dongle server running. You can connect to it from a PC on the LAN. I'll probably do a command line version of DVAPTool for Arm as well.

1606. Getting started

Yahoo group: DVAPDongle
Date: 2012-06-13 23:04:25 UTC
From: wolobmp
Topic: 1606 Message: 1606

Hello all. I have purchased a used DVAP, installed the drivers and downloaded and installed the .exe sftwr.
Like to know once I enter my callsign (it is registered within the system)
what information needs to be plugged into the ht in order to work with the DVAP?
I have a blue led that is lit, so looks like everything is running.

I've used DSTAR for a few yrs now, but was through a local machine, but it was taken off the air and now there is void in the area.

Please advise steps on what I need to do to get all in working order.

Also, has anyone used a different antenna then the stock one that comes with the DVAP? I am in need of a new antenna, as the one I purchased used, needs some "help".

Will wait to read the replies.
Thank you
Mike

1613. Westell DSL Modem/Router Issue

Yahoo group: DVAPDongle
Date: 2012-06-15 03:25:59 UTC
From: k7pa
Topic: 1613 Message: 1613

I had an internet/network issue which is described below: The fix I employed was to make the Westell Modem/Router Model 7500 version 5.01.01.04 into a Bridge and use my old Linksys WRT54GS wireless router for my local network.

Once I made the change, I've not had any issues with DVAP or any other internet/network programs.

==========

Have a real strange issue. I was operating from Sun Lakes Arizona with no issues. I returned to my summer home in Everett Washington and now having all kinds of strange issues.

The DVAP tool does not indicate that I'm connected but I can hear all transmissions from REF001C.

I sure this is a network issue, but I'm not sure how to troubleshoot to verify where the problem is occurring so that I can contact my ISP if needed to resolve the issue.

Also, I cannot ping the following reflectors. 2, 7, 8, 10, 11, 12, 21, 35, 36, 38, 40, 44, 47, 52.

When in AZ, I was able to connect to 12, 35, & 38. The others I don't remember connecting to.

I'm using the same PC and radio (IC-92AD)

Any suggestions to determine if this is a network issue or whatever, would be greatly appreciated.

The DVAP tool does not indicate that I'm connected but I can hear all transmissions from REF001C.

I sure this is a network issue, but I'm not sure how to troubleshoot to verify where the problem is occurring so that I can contact my ISP if needed to resolve the issue.

Also, I cannot ping the following reflectors. 2, 7, 8, 10, 11, 12, 21, 35, 36, 38, 40, 44, 47, 52.

When in AZ, I was able to connect to 12, 35, & 38. The others I don't remember connecting to.

I'm using the same PC and radio (IC-92AD)

Any suggestions to determine if this is a network issue or whatever, would be greatly appreciated.

1615. Command line for DVAP

Yahoo group: DVAPDongle

Hi Fran. You can do that with the DV Dongle but not the DVAP (currently).

Thanks Robin,
yes, I do it with the dongle. It would be a nice feature for the DVAP. :)

1618. question on reflector

Yahoo group: DVAPDongle
Date: 2012-06-24 05:22:19 UTC
From: wolobmp
Topic: 1618 Message: 1618

Hello all....

Quick question....what is the proper prompt entery to be able to xmit on the reflector? I understand that CQCQCQ does not "go thru" reflectors, but is used for local communications. USEREF is this a valid entry within R2 field? I use UR--CQCQCQ R1--callsign and R2--REF001 C

Thank you
73
Mike

Hi Mike. You use "CQCQCQ " in URCALL for talking locally and talking to linked gateways/reflectors. R1 and R2 should have the local repeater with R1 using the RF module in the 8th position and R2 always having "G" in the 8th position.

I assume you are talking directly to a repeater since the DVAP does not support 70cm.

Whether CQCQCQ is in the UR field or not has nothing to do with whether your transmission goes to a linked reflector or stays with the local repeater. That's what the R1 and R2 fields control. Other things in the UR field access local commands or specify a target for call sign routing.

With DVAP, both R1 and R2 should be blank (just as if you were doing simplex D-Star) and UR should be CQCQCQ to send things to a linked reflector. The DVAP software implements local commands similar to those used with repeaters (ID, echo test, link/unlink).

Hi Wayne. It sounds like the device drivers for the ftdi USB chip did not install. Go to http://www.ftdichip.com/Drivers/VCP.htm and select "setup executable" on the Windows line to download the drivers. Then run the installer.

The "No Gateways Found" message indicates that DVAPTool could not connect to the gateway name server. I looked through the logs and did not see any problems.

Without your callsign, I cannot look for log entries from your trials.

Hi Robin,

My call is W2UIS.

Everything was working fine Sunday morning then my system went down.

I called Frontier technical support who tried to work out the problem without success.

I connected the computer to the internet using using the iPhone and the DVAP worked flawlessly.

I will call Frontier this morning and request a replacement modem.

Hi Mark. We've seen some of the ISP supplied modems have issues dropping the UDP packets used by D-STAR. One fix we've seen is to place the modem in bridging mode and have a connected router authenticate to the ISP. That is worth a try if your ISP requires authentication.

I've been having a similar problem. Everything works fine for several hours, and then I start missing keep alives. Eventually I get disconnected from the reflector I'm on. This can happen several times an hour or only once a day. I've checked with Time Warner Cable and they see no issues (I also see my computer screen freeze up once in a while). I have both a direct cable to the router and another computer using wi-fi. Same issues on both. If I take those computers and go wireless to Verizon Wireless, there are no issues.

Still hunting for the solution!

It sounds as if your home router or ISP doesn't support the proper protocols. I'd suggest switching routers first.

Subject: [DVAPDongle] DVAP Internet Connection

Why does my dvap connect to the internet every where else (McDonalds) except my home connection?

The dvap works with my wireless hotspot so I know it's not a problem with my computer.

Hi Robin,

I have a small suggestion for add a new option to future DVAPTOOL...

Can you add a offset shift + or - with DUP mode and rpt1 & rpt2 option for make a low power link to D-Star repeater when we not have Internet connection to repeater site ?

Your DVAP is a good size and power for make a link !

And also awaiting your UHF version of DVAP !

Best 73'z

I havent checked to see if I have been missing anything. So here is what I have:
DVAPTool 1.02
DVAP application firmware 1.05

Is this the latest???

I've had the DVAP for a few years now and love it. I take it camping with me and it has been up and down the east coast. It works flawlessly using XP on my cheap ACER laptop with internet provided by my droid smart phone.Great little toy!! Thanks-Jarrod K1LVA

Hi Jarrod. You have the latest firmware and released software. Watch the group for an announcement of new software which will be released very soon. Some folks may have already found it... :)

Sounds like you have created a contest to see who can find it first. Keep up the good work

Robin, I installed the new version 1.03 but when it starts it tells me
there is a new version. Is there one newer than 1.03?
